PUBLISHERS' NOTE ON THE COMPLETED WORK

WITH the publication of the Atlas which is incorporated in the present edition The Century Dictionary and Cyclopedia has been brought to completion. As the Cyclopedia of Names grew out of the Dictionary and supplemented it on its encyclopedic side, so the Atlas has grown out of the Cyclopedia, and serves as an extension of its geographical material. Each of these works deals with a different part of the great field of words,—common words and names,—while the three, in their unity, constitute a work of reference which practically covers the whole of that field. The total number of words and names defined or otherwise described in the completed work is about 450,000.

The special features of each of these several parts of the book are described in the Prefaces which will be found in the first, ninth, and tenth volumes. It need only be said that the definitions of the common words of the language are for the most part stated encyclopedically, with a vast amount of technical, historical, and practical information in addition to an unrivaled wealth of purely philological material; that the same encyclopedic method is applied to proper names—names of persons, places, characters in fiction, books—in short, of everything to which a name is given; and that in the Atlas geographical names, and much besides, are exhibited with a completeness and serviceableness seldom equaled. Of The Century Dictionary and Cyclopedia as a whole, therefore, it may be said that it is in its own field the most complete presentation of human knowledge—scientific, historical, and practical—that exists.

Moreover, the method of distributing this encyclopedic material under a large number of headings, which has been followed throughout, makes each item of this great store of information far more accessible than in works in which a different system is adopted.

The whole represents fifteen years of labor. The first edition of The Century Dictionary was completed in 1891, and that of the Century Cyclopedia of Names in 1894. During the years that have elapsed since those dates each of these works has been subjected to repeated careful revisions, in order to include the latest information, and the results of this scrutiny are comprised in this edition.

 tube, duty : see Preface, pp. ix, x).
 u as in pull, book, could.
 ü German ü, French u.

oi as in oil, joint, boy.
 ou as in peered, proceed, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus :

ē as in prelate, courage, captain.
 ē as in ablegate, episcopal.
 ô as in abrogate, eulogy, democrat.
 ô as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *a*-sound (of but, pun, etc.). See Preface, p. xi. Thus :

ä as in errant, republican.
 ä as in prudent, difference.
 ä as in charity, density.
 ä as in valor, actor, idiot.

ā as in Persia, peninsula.
 ē as in the book.
 ū as in nature, feature.

A mark (˘) under the consonants *t*, *d*, *s*, *z* indicates that they in like manner are variable to *ch*, *j*, *sh*, *zh*. Thus :

˘t as in nature, adventure.
 ˘d as in arduous, education.
 ˘s as in pressure.
 ˘z as in seizure.

th as in thin.
 ʒh as in then.
 ch as in German ach, Scotch loch.
 ñ French nasalizing n, as in ton, en.
 ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, ˘ a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from* ; i. e., derived from.
 > read *whence* ; i. e., from which is derived.
 + read *and* ; i. e., compounded with, or with suffix.
 = read *copulate with* ; i. e., etymologically parallel with.

✓ read *root*.
 * read *theoretical or alleged* ; i. e., theoretically assumed, or asserted but unverified, form.
 † read *obsolete*.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus :

back¹ (bak), *n.* The posterior part, etc.
back¹ (bak), *a.* Lying or being behind, etc.
back¹ (bak), *v.* To furnish with a back, etc.
back¹ (bak), *adv.* Behind, etc.
back² (bak), *n.* The earlier form of *bat²*.
back³ (bak), *n.* A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "St." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan :

Section only § 5.
 Chapter only xiv.
 Canto only xiv.
 Book only iii.

Book and chapter }
 Part and chapter }
 Book and line }
 Book and page } iii. 10.
 Act and scene }
 Chapter and verse }
 No. and page }
 Volume and page II. 34.
 Volume and chapter IV. iv.
 Part, book, and chapter II. iv. 12.
 Part, canto, and stanza II. iv. 12.
 Chapter and section or ¶ vii. § or ¶ 3.
 Volume, part, and section or ¶ I. i. § or ¶ 6.
 Book, chapter, and section or ¶ I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discrimi-

nated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoölogical and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoölogy, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoölogical and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

salsify (sal'si-fi), *n.* [Also *salsafy*; = Sp. *salsifi* = Pg. *sersifim* = Sw. *salsafi*, < F. *salsifis*, dial. *serefi*, OF. *serefi*, *serchafi*, < It. *sassifera*, goat's-beard, < L. *saxum*, a rock, + *fricare*, rub: see *friction*. Cf. *sassifera*.] A plant, *Tragopogon porrifolius*. It is extensively cultivated as a vegetable, the long fusiform root being the esculent part. Its flavor has given rise to the name of *oster plant* or *vegetable oyster*. Also *purple goat's-beard*. See cut on preceding page.

Black salsify, *Scorzonera Hispanica*, a related plant with a root like that of salsify but outwardly blackish. It is similarly used, and its flavor is preferred by some.

salsilla (sal-sil'i), *n.* [< Sp. *salsilla*, dim. of *salsa* (= Pg. It. *salsa*), sauce: see *sauce*.] A name of several plants of the genus *Bomarea*, yielding edible tubers. *B. edulis* is cultivated in the West Indies its root being eaten like the potato; it is diaphoretic and diuretic. Other species, as *B. salsilla*, are natives of the Peruvian Andes, and are pretty twining plants with showy flowers.

salso-acid (sal'so-a'id), *a.* [< L. *salsus*, pp. of *salire*, salt, salt down, + *acidus*, acid.] Having a taste both salt and acid. [Rare.]

salt-soda (sal-sô'dä), *n.* Crystalline sodium carbonate. See *sodium carbonate*, under *sodium*.

Salsola (sal'sô-lä), *n.* [NL. (Linnaeus, 1737), < L. *salsus*, pp. of *salire*, salt, salt down, < *sal*, salt: see *sauce*.] 1. A genus of apetalous plants of the order *Chenopodiaceae*, type of the tribe *Salsolæ*. It is characterized by a single orbicular and horizontal seed without albumen, containing a green spiral embryo with elongated radicle proceeding from its center, by bisexual axillary flowers without disk or stamens, and with four or five concave and winged perianth-segments, and by unjointed branches with alternate leaves. There are about 40 species, mainly natives of Europe, northern Africa, and temperate and tropical regions of Asia: 10 are found in South Africa; one, *S. Kali*, is native on sea-beaches not only in Europe and western Asia, but in North and South America and Australia, also sparingly inland in the United States. They are herbs or shrubs, either smooth, hairy, or woolly, and bearing sessile leaves, often with a broad clasping base, sometimes elongated, sometimes reduced to scales, and often prickly-pointed. The small greenish flowers are solitary or clustered in the axils, and commonly persistent and enlarged about the small rounded utricular fruit. Various species are called *saltwort*, and *prickly glasswort*, also *kelpwort*.

Prickly Saltwort, *Salsola*

2. [L. c.] A plant of this genus.

salsolaceous (sal-sô-lä'shi-us), *a.* [< NL. *Salsola* + *-aceus*.] Of or pertaining to, or resembling the genus *Salsola*.

It is getting hopeless now; . . . sand and nothing but sand. The *salsolaceous* plants, so long the only vegetation we have seen, are gone.

H. Kingsley, *Geoffrey Hamlyn*, xlii.

Salsolæ (sal-sô-lë-ë), *n. pl.* [NL. (Moquin-Tandon, 1835), < *Salsola* + *-æ*.] A tribe of chenopodiaceous plants, typified by the genus *Salsola*. It embraces twenty other genera, chiefly natives of the temperate parts of the Old World.

salsuginose (sal-sû'ji-nôs), *a.* [< ML. *salsuginosus*, salty: see *salsuginous*.] In bot., growing in places inundated with salt water.

salsuginous (sal-sû'ji-nus), *a.* [Also *salsuginose*; < ML. *salsuginosus*, salty, < L. *salsugo* (also *salsilago*) (-gin-), saltiness, < *salsus*, pp. of *salire*, salt, < *sal*, salt: see *salt*.] Saltish; somewhat salt. [Rare.]

The distinction of salts, whereby they are discriminated into acid, volatile, or *salsuginous*, if I may so call the fugitive salts of animal substances, and fixed or alcalizate, may appear of use in natural philosophy.

Boyle.

A compound (NaCl) of chlorine with the metallic base of the alkali soda, one of the most abundantly disseminated and important of all substances. It not only occurs in numerous localities in beds sometimes thousands of feet in thickness, but also exists in solution in the ocean, forming nearly three per cent. by weight of its mass. It is not only of the greatest

importance in connection with the business of chemical manufacturing, but is also an indispensable article of food, at least to all men not living exclusively on the products of the chase. Salt often occurs crystallized, in the isometric system, and has when crystalline a perfect cubic cleavage. Its specific gravity is about 2.2. When pure it is colorless. As it occurs in nature in the solid form, it is almost always mixed with some earthy impurities, besides containing more or less of the same salts with which it is associated in the water of the ocean (see *ocean*). It is not limited to any one geological formation, but occurs in great abundance in nearly all the stratified groups. The Great Salt Range of India is of Lower Silurian age; the principal supply of the United States comes from the Upper Silurian and Carboniferous; the most important salt-deposits of England, France, and Germany are in the Permian and Triassic; the most noted deposits of Spain are Cretaceous and Tertiary; and those of Poland and Transylvania are of Tertiary age. Salt is obtained (1) from evaporation of the water of the ocean and of interior saline lakes; (2) from the evaporation of the water rising naturally in saline springs or obtained by boring; (3) by mining the solid material, or rock-salt. The supply of the United States is chiefly obtained by evaporating the water rising in holes made by boring. The principal salt-producing States are Michigan, New York, Ohio, Louisiana, West Virginia, Nevada, California, and Kansas; it is also produced in Utah. The two first-named States furnished in 1888 about three-quarters of the total product of the United States. The salt of California is made by the evaporation of sea-water; that of Utah from the water of Great Salt Lake; that of Louisiana and of Kansas, in part, is obtained by mining rock-salt. The product of the other States named comes chiefly from the evaporation of brine obtained by boring. Salt is of great importance as the material from which the alkali soda (carbonate of soda) is manufactured, and thus may be properly considered as forming the basis of several of the most economically important branches of chemical manufacture. Salt is also an article of great historical and ethnological importance. By many nations of antiquity it was regarded as having peculiar relations to mankind. Homer calls it "divine." It has been and is still used as a measure of value.

Let salt on the trenchere with knife that be clene;

Not to myche, be thou were, for that is not gode;

Booke of Precedence (E. E. T. S., extra ser.), i. 60.

Then, when the languid flames at length subside,

He strows a bed of glowing embers wide,

Above the coals the smoking fragments turns,

And sprinkles sacred salt from lifted urns.

Pope, *Iliad*, ix. 282.

Abandon those from your table and salt whom your own or others' experience shall deserv dangerous.

Bp. Hall, *Epistles*, i. 8.

2. In chem., any acid in which one or more atoms of hydrogen have been replaced with metallic atoms or basic radicals; any base in which the hydrogen atoms have been more or less replaced by non-metallic atoms or acid radicals; also, the product of the direct union of a metallic acid and an anhydrid. (*J. P. Cooke*, *Chem. Phil.*, p. 110.) The nomenclature of salts has reference to the acids from which they are derived. For example, *sulphates*, *nitrates*, *carbonates*, etc., imply salts of sulphuric, nitric, and carbonic acids. The termination -ate implies the maximum of oxygen in the acids, and -ite the minimum.

3. *pl.* A salt (as Epsom salts, etc.) used as a medicine. See also *smelling-salts*.—4. A marshy place flooded by the tide. [Local.]—5. A salt-cellar. [Now a trade-term or colloq.]

Garnish'd with salts of pure beaten gold.

I out and bought some things: among others, a dozen of silver salts.

Pepys, *Diary*, II. 165.

6. In her., a bearing representing a high decorative salt-cellar, intended to resemble those used in the middle ages. In modern delineations this is merely a covered vase.—7. Seasoning; that which preserves a thing from corruption, or gives taste and pungency to it.

Ye are the salt of the earth.

Mat. v. 13.

Let a man be thoroughly conscientious, and he becomes the salt of society, the light of the world.

8. Taste; smack; savor; flavor.

Though we are justices and doctors and churchmen, Master Page, we have some salt of our youth in us.

9. Wit; piquancy; pungency; sarcasm: as, Attic salt (which see, under *Attic*).

On wings of fancy to display

The flag of high invention, stay,

Repose your quills; your veins grow four,

Tempt not your salt beyond her power;

If your pall'd fancies but decline,

Censure will strike at every line.

I have no salt

B. Jonson, *Epigrams*, xlix.

They understood not the salt and ingenuity of a witty and useful answer or reply.

Jer. Taylor, *Works* (ed. 1835), I. 741.

10. Modification; hence, allowance; abatement; reserve: as, to take a thing with a grain of salt (see phrase below).

Contemporary accounts of these fair damsels are not very good, but it was rather a libellous and scurrilous age as regards women, and they might not be true, or at all events be taken with much salt.

J. Ashton, *Social Life in Reign of Queen Anne*, I. 135.

11. A bronzing material, the chlorid or butter of antimony, used in browning gun-barrels and other iron articles.—12^a. Lecherous desire.

Gifts will be sent, and letters which

Are the expressions of that itch

And salt which frets thy gutters.

Herrick, *The Parting Verse*.

13. A sailor, especially an experienced sailor. [Colloq.]

My complexion and hands were quite enough to distinguish me from the regular salt, who, with a sunburnt cheek, wide step, and rolling gait, swings his bronzed and toughened hands athwart-ships, half-opened, as though just ready to grasp a rope.

R. H. Dana, Jr., *Before the Mast*, p. 2.

Above the salt, seated at the upper half of the table, and therefore among the guests of distinction; below or beneath the salt, at the lower half of the table, and therefore among the inferior guests and dependents: in allusion to the custom of placing the principal or standing salt-cellar near the middle of the table.

His fashion is not to take knowledge of him that is beneath him in clothes. He never drinks below the salt.

In *saltier*. Same as *saltierwise* when applied to a number of small charges. — **Per saltier**, *saltierwise*. — **Quarterly in saltier**. Same as *per saltier*. — **Saltier arched**, a bearing consisting of two curved bands turning their convex sides to each other, tangent or conjoined, so as to nearly resemble a saltier. — **Saltier chequy**, a saltier whose field is occupied with small checkers in three or four rows, the lines which form the checkers being parallel to those bounding the saltier, and therefore oblique to the escutcheon. — **Saltier componé**, a saltier whose field is occupied with squares alternating of two tinctures: these are set square with the saltier, and therefore seem to be lozenges as regards the escutcheon.

Saltier conjoined in base, a saltier cut short in some way, as couped, and having the feet or extremities of the two lower arms united by a band, usually of the same width and tincture as the arms of the saltier. — **Saltier couped**, a saltier the extremities of which do not reach the edges of the field. — **Saltier couped and crossed**, a figure resembling a cross crosslet set saltierwise. 4. A provision of a law which enforces obedience by the enactment of rewards or penalties, called respectively *remuneratory* and *punitive sanctions*; hence, in utilitarian ethics, the knowledge of the pleasurable or painful consequences of an act, as making it moral or immoral.

By the laws of men, enacted by civil power, gratitude is not enforced: that is, not enjoined by the sanction of penalties to be inflicted upon the person that shall not be found grateful. *South.*

A Sanction then is a source of obligatory powers or motives: that is, of pains and pleasures; which, according as they are connected with such or such modes of conduct, operate, and are indeed the only things which can operate, as motives.

Bentham, Intro. to Morals and Legislation, iii. 2, note.

The fear of death is generally considered as one of the strongest of our feelings. It is the most formidable sanction which legislators have been able to devise.

Macaulay, Mill on Government.

The internal sanction of duty, whatever our standard of duty may be, is one and the same — a feeling in our own mind, a pain, more or less intense, attendant on a violation of duty. *J. S. Mill, Utilitarianism.*

The consequences which an action done here may have in the unseen world are the sanctions attached to it. *Hodgson, Phil. of Reflection, III. xi. § 6.*

External sanction, the knowledge of a fact in the external world which will result from an act either always or in the long run, and so produce pleasure or pain, as an inducement to do or refrain from that sort of act. — **Internal sanction**, the knowledge of mental reflection upon an act, productive of pleasure or pain, as an inducement to do or refrain from that sort of act. — **Legal sanction**, the knowledge that a penalty will probably be inflicted by a court for an act, as an inducement to refrain from that act. — **Moral sanction**, according to Bentham, the knowledge of how one's neighbors will take a given act, as a motive for doing or not doing it. Less strict utilitarians, as Mill, admit an internal sanction as moral. Non-utilitarian moralists often use the phrase *moral sanction*, but with no determinate signification. Thus, the intuitionist Calderwood (Handbook of Moral Philos., I. ii. 4, § 7) says: "Sanction is a confirmation of the moral character of an action, which follows it in experience."

This makes *sanction* in this phrase mean not a reward or punishment, but an attestation. On the other hand, the evolutionist Stephen (Science of Ethics, N. 1. 2) says: "According to my argument, the primary and direct incidence, if I may say so, of moral sanctions is upon the social organism, whilst the individual is only indirectly and secondarily affected." That is to say, races in which certain instincts are weak are unfitted to cope with other races, and go under; so that a moral sanction is a remote consequence of a line of behavior tending by natural selection to reinforce certain instincts. — **Physical sanction**, the knowledge that pleasure or pain will generally result from a given line of conduct by the operation of causes purely natural. — **Political sanction**, the hope of favor or fear of hostility on the part of a government as the consequence of, and thus a motive for or against, certain conduct. — **Popular sanction**, the knowledge that the people, in their private and individual capacity, will regard with favor or disfavor a person who acts in a given way, as a motive for or against such action. Bentham regards this as the same as *moral sanction*. — **Pragmatic sanction**. See *pragmatic*. — **Psychological sanction**, the knowledge that certain conduct, if found out, will act upon a certain mind or certain minds to cause those persons to confer pleasure or inflict pain upon the person who pursues such conduct, this knowledge being considered as a motive for or against that conduct. — **Punitive sanction**, the attachment of a penalty to a legal offense. — **Religious sanction**, the belief that God attaches rewards and punishments to his laws as a motive for obeying him. — **Remuneratory sanction**, the promise, as by a government, of a reward as an inducement to attempt a certain performance. — **Social sanction**. Same as *popular sanction*. — **Syn. I and 3.** Authorization, countenance, support, warrant.

1. A sacred or consecrated place; a holy spot; a place in which sacred things are kept.

Proverbs, like the sacred books of each nation, are the sanctuary of the intuitions. *Emerson, Compensation.*

Specifically — (a) In *Script.*, the temple at Jerusalem, particularly the most retired part of it, called the *holy of holies*, in which was kept the ark of the covenant, and into which no person was permitted to enter except the high priest, and that only once a year to intercede for the people. The same name was given to the corresponding part of the tabernacle in the wilderness (Ex. xxv. 8). (b) A house consecrated to the worship of God; a church.

And I saw crowds in column'd sanctuaries.

Tennyson, Fair Women.

(c) The cella or most sacred part of an Egyptian, Greek, or Roman temple. (d) In *classical antiq.*, a sacred place, a locality, whether enclosed or not, but generally enclosed, consecrated to some divinity or group of divinities, often a grove, sometimes an inclosure of notable size and importance, containing shrines, temples, a theater, arrangements for gymnastic contests, places of shelter for suppliants or for the sick, etc.: as, the *sanctuary of Æsculapius* at Epidaurus.

The stela was to be set up in a sanctuary, which, it seems probable, was that of Pandion on the Acropolis.

Harrison and Verrall, Ancient Athens, p. xcvi.

(e) The part of a church where the chief altar stands; the chancel; the presbytery. See *cut under veredos*.

The original arcade piers of the choir and sanctuary [the semicircular part of the choir, in the Abbey of St. Denis] do not exist. *C. H. Moore, Gothic Architecture, p. 37.*

(f) A portable shrine containing relics.

Than the kynge made be brought the hiest seintuaries that he hadde, and the beste relikes, and ther-on they dide swere. *Martin (E. E. T. S.), i. 75.*

(g) A churchyard.

Also wyth-ynne chyrche & seyntuary

Do rygt thus as I the say,

Songe and cry and suche fare,

For to stynte thow schalt not spare.

Myrc, Instructions for Parish Priests (E. E. T. S.), I. 330.

Seyntuary, churchyard. The name of E. T. S. is now given to that part of the choir or chancel of a church where the altar stands. In mediæval documents belonging to this country, Sanctuarium and its equivalents in English almost always mean churchyard.

Note in *Myrc's Instructions for Parish Priests* (E. E. T. S.), [p. 75.]

2. A place of refuge or protection; a sacred asylum; specifically, a church or other sacred place to which is attached the privilege of affording protection from arrest and the ordinary operation of the law to criminals, debtors, etc., taking refuge within its precincts. From the time of Constantine downward certain churches have been set apart in many Catholic countries to be an asylum for fugitives from the hands of justice. In England, particularly down to the Reformation, any person who had taken refuge in such a sanctuary was secured against punishment — except when charged with treason or sacrilege — if within the space of forty days he gave signs of repentance, and subjected himself to banishment. By the act 21 James I., c. xxviii., the privilege of sanctuary for crime was finally abolished. Various sanctuaries for debtors, however, continued to exist in and about London till 1697, when they too were abolished. In Scotland the abbey of Holyrood House and its precincts still retain the privilege of giving sanctuary to debtors, and one who retires thither is protected for twenty-four hours; but to enjoy protection longer the person must enter his name in the books kept by the bailie of the abbey. Since the abolition of imprisonment for debt this sanctuary is no longer used.

That Cytee was also Sacerdotalle — that is to sayne, seyntuarie — of the Tribe of Juda. *Mandeville, Travels, p. 66.*

The schoolhouse should be counted a sanctuarie against feare. *Ascham, The Scholemaster, p. 49.*

Your son is slain, Theodoret, noble Theodoret!

Here in my arms, too weak a sanctuary

'Gainst treachery and murder!

Beau. and Fl., Thierry and Theodoret, iii. 2.

Let's think this prison holy sanctuary,

To keep us from corruption of worse men.

Fletcher (and another), Two Noble Kinsmen, ii. 1.

Whitefriars, adjacent to the Temple, then well known by the cant name of Alsatia, had at this time, and for nearly a century afterwards, the privilege of a sanctuary, unless against the writ of the Lord Chief Justice. . . . The place abounded with desperadoes of every description — bankrupt citizens, ruined gamblers, irreclaimable prodigals. *Scott, Fortunes of Nigel, xvi.*

3. Refuge; shelter; protection; specifically, the immunity from the ordinary operations of law afforded by the sacred character of a place, or by a specially privileged church, abbey, etc.

The Chapell and Refectory [were] full of the goods of such poor people as at the approach of the Army had fled with them thither for sanctuary.

Evelyn, Diary, Aug. 7, 1641.

At this time, upon News of the Earl of Warwick's Approach, Queen Elizabeth forsaketh the Tower, and secretly takes Sanctuary at Westminster.

Baker, Chronicles, p. 209.

These laws, whoever made them, bestowed on temples the privilege of sanctuary. *Milton.*

and the final result is the complete and rapid cutting of

the hardest glass or stone. Paper or gelatin laid on the

surface resists the sand and makes it possible to cut on

sand-jet (sand'jet), *n.* An apparatus whereby sharp sand is fed to a jet of compressed air or a steam-jet, and driven out forcibly against a surface which it is desired to abrade. It has within a few years been extensively applied to the ornamentation of glass, and to some extent in the operations of stone-cutting and the smoothing and cleaning of cast-iron hollow ware. In the ornamentation of glass, stencils are placed upon the surface, which protect from abrasion the parts covered, and the abraded parts take the form of the pattern cut in the stencil. A very short exposure to the sand-jet produces the tracing of the pattern in a fine-frosted, well-defined figure. The effectiveness of the jet when air or steam at high pressure is used renders it competent to cut and drill even corundum. The results attained, when the simplicity of the means employed are considered, render this one of the most interesting of modern inventions. See *sand-blast*.

The toes are four in number (excepting *Calidris*), and cleft to the base (excepting *Micropalama* and *Ereunetes*). The sandpipers belong especially to the northern hemisphere, and mostly breed in high latitudes; but they perform the most ex-

tensive migrations, and in winter are generally dispersed over the world. The sexes are alike in plumage, but the seasonal changes of plumage are very great. The sandpipers are probably without exception gregarious, and often flock the beaches in flocks of hundreds or thousands. They live preferably in open wet sandy places, not in swamps and fens, and feed by probing with their sensitive bills, like snipes. Among them are the most diminutive of waders, as the tiny sandpipers of the genus *Actodromas* called *stints*. The semipalmated sandpiper is no larger, but has basal webs; it is *Ereunetes pusillus* of America. The spoon-billed sandpiper, *Euryornis hutchinsii*, is another diminutive bird, of Asia and arctic America. The stilt-sandpiper has long legs and semipalmated feet: it is *Micropalama himantopus*. The broad-billed sandpiper is *Limicola pygmaea* or *platyrhyncha*, not found in America. The pectoral sandpiper, or grass-snipe, is *Actodromas maculata*, a characteristic American species

Grass-snipe, or Pectoral Sandpiper (*Tringa p. l. t. b. maculata*)

of comparatively large size. Dunlins or purres are sandpipers of the genus *Pelidna*. The curlew-sandpiper is *Ancylochilus subquatus*. The purple sandpipers are several species of *Argyrotella*, as *A. maritima*. The knot, canute, red or red-breasted, or ash-colored sandpiper, or robin-snipe, is *Tringa canutus*. (b) A bird of the same family and subfamily as the foregoing, but of the section *Totaneae*, or tattlers, several but not all of which are also known as sandpipers, because they used to be put in the old genus *Tringa*. The common sandpiper of Europe, etc., is *Tringoides* or *Actitis hypoleucos*, of which the common peewee or spotted sandpiper of the United States, *T. macularius*, is a close ally. Green sandpipers belong to the genus *Rhyacophilus*, as *R. ochropus* of Europe and *R. solidarius* of America. The wood-sandpiper of Europe is *Totanus glareola*. The fighting sandpiper is the ruff, *Machetes* or *Pavonella pugnax*. The buff-breasted sandpiper is a peculiar American species, *Tryngites rufescens* or *subruficollis*. The Bartramian sandpiper is *Bartramia longicauda* or *Actitis bartramia* of America. See the technical and special names, and cuts under *Bartramia*, *dunlin*, *Ereunetes*, *Euryornis hutchinsii*, *Micropalama*, *Rhyacophilus*, *ruff*, *sanderting*, *stint*, *Tringa*, *Tringoides*, and *Tryngites*.

sandstone (sand'stōn), *n.* [= D. *zandsteen* = G. *zandstein* = Sw. *Dan. sandsten*; as *sand* + *stone*.] A rock formed by the consolidation of sand. The grains composing sandstone are almost ex-

clusively quartz, this mineral resisting decomposition, and only becoming worn into finer particles as abrasion continues, while almost all other minerals entering into the composition of ordinary rocks are liable to dissolve and be carried away in solution, or be worn down into an impalpable powder, so as to be deposited as mud. Sandstones may contain also clayey or calcareous particles, or be cemented by so large a quantity of ferruginous or calcareous matter as to have their original character quite obscured. Hence varieties of sandstones are qualified by the epithets *argillaceous*, *calcareous*, *ferruginous*, etc. **Berea sandstone**, a sandstone or grit belonging to the Carboniferous series, extensively quarried as a building-stone and for grindstones in Ohio and especially in the vicinity of Berea (whence the name).—**Caradoc sandstone**, a sandstone of Lower Silurian age, very nearly the geological equivalent of the Bala group in Merionethshire, Wales, and of the Trenton limestone of the New York geologists. The name was given by Murchison, from the locality of Caer Caradoc, in Shropshire, England.—**Flexible sandstone**. See *staccolite*.—**Medina sandstone**, a red or mottled and somewhat argillaceous sandstone forming, according to the classification of the New York Survey, the base of the Upper Silurian series. It corresponds nearly to the *Levant* or *No. IV.* of the Pennsylvania Survey.

A mountain of IV. is perhaps the commonest expression in American geology. These mountains are very numerous, being reiterated outcrops or reappearances and disappearances of the *Medina sandstone* as it rises and sinks in the Appalachian waves.

J. P. Lesley, Coal and its Topography, p. 59.

New Red Sandstone, a name formerly given in England to a great mass of strata consisting largely of red shales and sandstones and overlying rocks, belonging to the Carboniferous series. A part of the New Red Sandstone is now considered to belong to the Permian series, since the organic remains which it contains are decidedly Paleozoic in character. The upper division of these red rocks, although retaining to a very considerable extent the same lithological characters as the lower division, differs much from it in respect to the fossils it contains, which are decidedly of a Mesozoic type, and form a portion of the so-called Triassic series. The term *New Red Sandstone* is still used to some extent in England, and has been applied in the United States to the red sandstones of the Connecticut river valley, which are generally considered to be of Triassic age. See *Triassic*.

Old Red Sandstone, a name given in England, early in the history of geology, to a group of marls, sandstones, tilestones, and conglomerates seen over an extensive area, and especially in Herefordshire, Worcestershire, Shropshire, and South Wales, cropping out from under the coal-measures and resting on the Silurian. These rocks were called *Old Red*, to distinguish them from a somewhat similar series overlying the Carboniferous, and designated as the *New Red Sandstone*. The name *Devonian* was given later by Sedgwick and Murchison to rocks occurring in Devon and Cornwall and occupying a stratigraphical position similar to that of the *Old Red*, and the name *Devonian* is now in general use throughout the world as designating that part of the geological series which lies between the Silurian and the Carboniferous. The name *Old Red Sandstone* has, however, been retained by English geologists to designate that peculiar type of the Devonian which is less distinctively marine than the Devonian proper, and which is characterized by the presence of numerous land-plants and ganoid fishes, as well as by the absence of unequivocally marine organisms. The areas in which these deposits were laid down are generally considered to have been lakes or inland seas. The *Old Red Sandstone*, as thus limited, seems to have been almost exclusively confined to the British Isles; and it is particularly well developed in Scotland, and also is of considerable importance in Ireland.—**Oriskany sandstone**, the name given by the New York Geological Survey to a group of strata lying between the Lower Helderberg group and the Canda-galli grit, and considered by James Hall as forming the uppermost division of the Upper Silurian. In central New York it is chiefly a silicious sandstone, but is sometimes argillaceous; it extends west as far as Missouri, becoming more calcareous. *Spirifer arenosus* is a very characteristic fossil of this group over a wide area. It is No. VII. of the numerical designation of the Pennsylvania Survey, and the "Meridian" of H. D. Rogers's nomenclature.—**Pocono sandstone**, a very thick and persistent mass of sandstones and conglomerates underlying the Mauch Chunk Red Shale, and forming the base of the Carboniferous in Pennsylvania. It is No. X. of the numerical notation of the First Pennsylvania Survey, and the same as the "Vespertine" of H. D. Rogers.

The Pottsville conglomerate forms a rim around the coal basins, and the *Pocono sandstone* and conglomerate an outer rim, with a valley included between them eroded out of the Mauch Chunk red shale.

Potsdam sandstone, in *geol.*, the lowest division of the Lower Silurian, and the lowest zone in which distinct traces of life have been found in the United States; so named by the geologists of the New York Survey from a town of that name in that State. The formation is a conspicuous and important one further west through the region of the Great Lakes. It is the equivalent of the Primordial of Barrande, and of the Cambrian or Cambro-Silurian of some geologists. Among the fossils which characterize this formation are certain genera of brachiopods (*Lingulella*, *Obolella*, *Orthis*, *Discina*) and trilobites of the genera *Conocozygia* and *Pandorites*. The Potsdam, Primordial, or Cambrian rocks have been variously subdivided in Europe and America within the past few years. Thus, the Canadian geologists call the lower section, as developed in Newfoundland, Nova Scotia, and New Brunswick, *Acadian*, and the overlying beds *Georgian*. In Nevada five divisions have been made out. The rocks thus designated, however, are paleontologically closely related; neither is there, in the opinion of most Continental geologists, any sufficient reason for separating the Cambrian, as a system, from the Silurian.—**St. Peter's sandstone**, a sandstone, from 60 to 100 feet in thickness, consisting of almost chemically pure silicious material, which lies next above the so-called Lower Magnesian limestone in the upper Mississippi lead region,

sand-plover (sand'pluv'ēr), *n.* A ringneck, ring-necked plover, or ring-plover; any species of the genus *Epiphetes*, as a ring-dotted, which frequents sandy beaches. See cuts under *Epiphetes* and *piping plover*.

sand-prey (sand'prē), *n.* Same as *sand-pride*.

sand-pride (sand'prīd), *n.* A petromyzontoid vertebrate, also known as *mud-lamprey* and *sandpiper*, in its young or larval condition, when it has a short horseshoe-shaped mouth. It is found in many rivers and streams of Europe, reaches a length of over 7 inches, and is of a brown color. See *pneustes*.

sand-pump (sand'pūmp), *n.* 1. In *rope-drilling*, a cylinder, provided with a valve at the bottom, which is lowered into the drill-hole from time to time to remove the pulverized rock, or sludge. Also called *sludger*. [Pennsylvania oil regions.]—2. A powerful water-jet with an annular nozzle inclosing a tube which is sunk in loose sand, and operates as an injector to lift the sand with the water which discharges back through the tube. This form is used in caissons for making foundations, and is sometimes called a *sand-lifter*. It is a modification of the jet-pump. The water, passing upward around the upper end of the suction pipe, produces an upward draft of suction on the angled sand and water below, drawing it upward and discharging it through *d*.

sand-rat (sand'rāt), *n.* A pocket-gopher of the genus *Thomomys*, found in sandy places in the western coast region of North America; the commonest rat. The term applies to some other members of the family as the common *Thomomys talpoides*. See cuts under *conglomerate* and *gopher*.

and extends further to the north into Minnesota. It is almost entirely destitute of fossils, but from its stratigraphical position it is considered to be nearly of the same age as the Chazy limestone of the New York Survey.

sand-storm (sand'stôrn), *n.* A storm of wind that bears along clouds of sand.

sand-sucker (sand'suk'er), *n.* 1. The rough dab, *Hypoglossoides limandoides*, also called *sand-fluke* and *sand-eucker*. The name is due to the erroneous idea that it feeds on nothing but sand. *Days*, Fishes of Great Britain and Ireland, II, 10.

2. In the United States, a general popular name for soft-bodied animals which hide in the sand, sometimes exposing their suckers, tentacles, or other parts, as ascidians, holothurians, or nereids.

sand-swallow (sand'swol'ô), *n.* Same as *bank-swallow*.

sand-thrower (sand'thrô'er), *n.* A tool for throwing sand on sized or painted surfaces. It consists of a hollow handle in which a supply of sand is contained, and from which it passes into a conical or V-shaped box. The box ends in a narrow slit from which the sand issues, distributed by a projecting lip.

sand-trap (sand'trap), *n.* In *hydraulic engine*, a device for separating sand and other heavy particles from running water. It consists substantially of a pocket or chamber in which the sand is collected by a sudden change in the direction of the flow, which causes the momentum of the particles to carry them out of the stream into the collecting-chamber, or by a sudden reduction of velocity through an abrupt enlargement in the pipe or channel which conducts the stream, whereby the heavy particles are permitted to gravitate into the receiving pocket, or by the use of a strainer which intercepts the particles and retains them, or by a combination of these principles.

Sand-trap in section. *A*, inlet from body; *B*, cover; *C*, finely perforated diaphragm; *D*, collecting-chamber; *E*, outlet; *F*, valve; *G*, plug for clearing out sand.

sand-wasp (sand'wosp), *n.* A fossorial hymenopterous insect which digs in the sand; a digger-wasp, as of either of the families *Pompilidae* and *Sphegidae*, and especially of the genus *Amphipila*. There are many species, and the name is a loose one. Some of these wasps belong to the *Scoliidae*; others, as of the family *Crabronidae*, are also known as *sand-horns*, and many are popularly called *sand-bugs*. The general distinction of these wasps is from any of those which build their nests of papery tissue, or which make their cells above ground. See cuts under *Amphipila*, *Crabro*, *Elis*, and *digger-wasp*, and compare *potter-wasp*.

sandweed (sand'wed), *n.* 1. Same as *assandwort*. — 2. The spurry, *Spergularia arvensis*. [Prov. Eng.]

sandweld (sand'weld), *v. t.* To weld with sand (silica), which forms a fluid slag on the welding-surface; a common method of welding iron. When the pieces to be welded are put together and hammered, the slag is forced out and the metallic surfaces left bright and free to unite.

sandwich (sand'wich), *n.* [Named after John Montagu, 4th Earl of Sandwich (died 1792), who used to have slices of bread with ham between brought to him at the gaming-table, to enable him to go on playing without intermission. The title is derived from *Sandwich*, < ME. *Sandwiche*, AS. *Sandwic*, a town in Kent, < sand, sand, + vic, town.] 1. Two thin slices of bread, plain or buttered, with some savory article of food, as sliced or potted meat, fish, or fowl, placed between: as, a ham sandwich; a cheese sandwich.

It consisted of 71 members, composed of the chief priests, elders, and scribes, and held daily sessions, except on sabbaths and festivals; specifically styled the *great sanhedrim*, to distinguish it from the *lesser* or *provincial sanhedrim* of 23 members appointed by the great sanhedrim, and having jurisdiction over minor civil and criminal cases. Such lesser tribunals were set up in towns and villages having not fewer than 120 representative men, including a physician, a scribe, and a schoolmaster. The great sanhedrim is said in the Talmud to have had its origin in the appointment by Moses of 70 elders to assist him as magistrates and judges (Num. xi. 16). The Greek origin of the name, however, seems to indicate that the thing originated during the Macedonian supremacy in Palestine. The name was dropped under the presidency of Gamaliel IV. (A. Santalaceæ (san-ta-lā'sē-ē), *n. pl.* [*NL. (R. Brown, 1810), < Santalum + -aceæ.*] *An order of apetalous plants of the series Achlamidoporeæ. It is characterized by a one-celled inferior ovary with one, two, or three ovules, pendulous from the summit of a slender erect stalk or funiculus, and by a green or colored perianth of one row, commonly of four or five valvate lobes with as many stamens, and a flat, ring-like, or sheathing disk. The fruit is a nut or more often a drupe, the exocarp either thin and dry or fleshy, or sometimes thick, the nut or stone containing a roundish smooth, wrinkled, or deeply furrowed seed. The species are either trees, shrubs, or low herbs, a few parasitic on branches or on roots. They are distinguished from the allied Loranthaceæ by the structure of the ovary, as well as their habit, which still more strikingly separates them from the Balanophoraceæ. There are about 200 species, distributed in 28 genera and 4 tribes, widely dispersed in tropical and temperate regions throughout the world. The leaves are alternate or opposite, smooth and entire, with the veins obscure, or sometimes all reduced to mere scales. The flowers are small or rarely conspicuous, green or yellowish, less often orange. Three genera extend into the United States—Canadara, Pyrolaria, and Euclaya. For illustrative genera, see Santalum (the type), Oxyria, and Pyrolaria.*

The juice or fluid which circulates in all plants, being as indispensable to vegetable life as is the blood to animal life. It is the first product of the digestion of plant-food, and contains the elements of vegetable growth in a dissolved condition. The absorption of nutriment from the soil is effected by the minute root-hairs and papillae, the absorbed nutriment being mainly composed of carbonic acid and nitrogenous compounds dissolved in water. This ascending sap, or as it is termed *crude sap*, is apparently transmitted through the long cells in the vascular tissue of the stem and branches to the leaves, passing from cell to cell by the process known as *endosmosis*. In the leaves is effected the process of digestion or assimilation, with the following results: (1) the chemical decomposition of the oxygenated matter of the sap, the absorption of carbon dioxide (carbonic acid), and the liberation of pure oxygen at the ordinary atmospheric temperature; (2) a counter-operation by which oxygen is absorbed from the air, and carbon dioxide exhaled; (3) the transformation of the remaining crude sap into organic substances which enter into the composition of the plant: this change is effected in the chlorophyll-cells of the leaves under the influence of light, and the assimilated sap, or as it is termed *elaborated sap*, descends through the branches and stem to the growing parts of the plant requiring the same, there to be used up, after undergoing a series of changes included under the name *metastasis*, or to form deposits of reserve material lodged in various parts for future use. The ascent of the sap is one of the most wonderful phenomena of spring, and apparently depends not so much on the state of the weather—for it begins in the depth of winter—as on the plant having had its sufficient term of rest, and being, therefore, constrained by its very nature to renewed activity. Hence—2. The juice or fluid the presence of which in anything is characteristic of a healthy, fresh, or vigorous condition; blood.

Sarcophaga¹ (sär-kof'ā-gā), *n.* [*NL. (Meigen, 1826), fem. sing. of sarcophagus, flesh-eating; see sarcophagus.*] A genus of dipterous insects, typical of the family *Sarcophagidae*; the flesh-flies. They are large or small, moderately bristly species, recognizable from the lengthened three-striped scutellum and from cubical claret-colored spots on the abdomen. These flies are viviparous, and deposit living larvae upon decaying animal substances. Some have been considered parasitic upon other insects, but probably they never deposit upon living larvae or pupae. They have been known to breed in ulcerous sores upon man and other mammals. The species are numerous, over 50 inhabiting the United States. *S. carnaria* is the European flesh-fly, by some authors considered identical with the North American *S. similis*, in which case the former is said to be cosmopolitan. See cut under *flesh-fly*.

(Tournefort, 1700), named after Dr. Sarrazin of Quebec, who first sent specimens and a description to Europe.*] A genus of polypetalous plants, known as *sidesaddle-flower* and *pitcher-plant*, type of the order *Sarracenaceae*. It is characterized by flowers with five thick and spreading sepals, five petals curving together, numerous short stamens, and a large five-lobed and five-celled ovary with its distinct style dilated at the

top into a peltate umbrella-like and petaloid membrane, which is stigmatic near the end of a nerve extending to each of its five angles. The 8 species are all natives of North America, and occur chiefly in the southern United States, with one also in the northern. They are remarkable plants, inhabiting peat-bogs, with their leaves transformed into pitchers, and produced at the top into a more or less arching hood, which closes the pitcher when young. The pitchers are usually partly filled with rain-water and with masses of decomposing insects, and in some species special glands secrete a digestive fluid which aids in their assimilation. The flowers are large, solitary, and nodding upon a long leafless scape, usually of a deep brownish red, globular in the bud, flattened on expansion, and with petals which are strongly contracted in the middle. *S. purpurea*, the original species, which extends north to Great Bear Lake, is known as *pitcher-plant*, also as *huntsman's-cup* and *sidesaddle-flower*. *S. flava* and other southern species are known as *trumpet-plant* and *huntsman's-horn*.

It is characterized by a minute embryo near the base of the seed in fleshy albumen, and flowers with five sepals and five petals, numerous stamens, and a five- or three-celled ovary with the placenta fixed to the inner axis. They are readily distinguished by their peculiar habit, being bog-plants with conspicuous flowers nodding upon naked scapes, surrounded at the base by a circle of radical leaves, which are inflated into pitchers, and project in front into a thin lamina, and at the top into a hood. The 10 species are all American, and belong mainly to the type genus, *Sarracenia*—the others, *Darlingtonia* and *Heliamphora*, being monotypic. See cuts under *Darlingtonia* and *pitcher-plant*.

A tree, the only species of the genus *Sassafras*. It is common in eastern North America, in the south taking possession, along with the persimmon, of abandoned fields. It reaches a height of about 45 feet. Its wood is light and soft, coarse-grained, not strong, but very durable in contact with the soil, used for fencing, in cooperage, etc. The root, especially its bark, enters into commerce as a powerful aromatic stimulant, and is much used in flavoring and scenting, an oil being distilled in large quantities for the latter purposes. The bark is officinal, as also the pith, which affords a mucilaginous application and a drink. An early name in England was *aguetree*.

The spelling *satyre*, *satyr*, *L. satyra*, was due to confusion with *satyr*¹; so *satiric* was confused with *satyric*.] 1. A literary composition, originally in verse, characterized by the expression of indignation, scorn, or contemptuous facetiousness, denouncing vice, folly, incapacity, or failure, and holding it up to reprobation or ridicule: a species of literary production cultivated by ancient Roman writers and in modern literature, and directed to the correction of corruption, abuses, or absurdities in religion, politics, law, society, and letters.

The first and most bitter inuective against vice and vicious men was the *Satyræ*.

Puttenham, Arte of Eng. Poesie, p. 24.

Pope, Essay on Criticism, l. 592.

= *Syn.* 1. *Pasquade*, *Invective*, etc. See *Lampoon*.—2. *Irony*, *Sarcasm*, *Satire*, *ridicule*. *Irony* may be of the nature of *sarcasm*, and *sarcasm* may possibly take the form of *irony*; but *sarcasm* is generally too severe, and therefore too direct, to take an ironical form; both may be means of *satire*. The essential thing about *irony* is the contradiction between the literal and the manifest meaning: as, "Is not a patron, my lord, one who looks with unconcern on a man struggling for life in the water, and when he has reached the ground, encumbers him with help?" (*Johnson*, To Chesterfield.) "*Irony* . . . is the humorous wresting of language from its literal use for the expression of feeling, either happy or painful, but too vehement to be contented with that literal use. . . . When the thoughtful spirit of Macbeth is distorted by guilt, and as the agony of that guilt grows more and more intense, the pent-up misery either flows forth in a subdued *irony* or breaks out in that which is fierce and frenzied." (*H. Reed*, Eng. Lit., p. 366.) The essential thing about *sarcasm* is its cutting edge; it therefore is intensely concentrated, lying in a sentence or a phrase; it is used to scourge the follies or foibles or vices of men, but has little of reformatory purpose. *Satire* is more elaborate than *sarcasm*, is not necessarily bitter, and has, presumably, some aim at the reformation of that which is satirized. "Well-known instances of ironical argument are Burke's 'Vindication of Natural Society,' in which Bolingbroke's arguments against religious institutions are applied to civil society; Whately's 'Historic Doubts,' in which Hume's arguments against Christianity are used to prove the non-existence of Napoleon Bonaparte; Swift's 'Argument against the Abolishment of Christianity,' and his 'Modest Proposal' for relieving Ireland from famine by having the children cooked and eaten." (*A. S. Hall*, Rhetoric, p. 193.)

A *saturater* . . . for supplying saturated air at the temperature of the room.

Trans. of Cambridge Phil. Soc., XIV. 37.

(b) In air compressors, an apparatus that injects water into the compressor-cylinder to absorb the heat-equivalent of the work of compression: so called because the air leaves the compressor saturated with aqueous vapor. (c) In the production of the ether-oxygen lime-light, an apparatus for saturating oxygen with ether vapor. Also *saturator*.

saturation (sat'ū-rā'shon), *n.* [*<* *F.* *saturation* = Sp. *saturación* = Pg. *saturação* = It. *saturazione*, < LL. *saturatio* (-n-), a filling, saturating, < L. *saturare*, fill, saturate: see *saturate*.] The act of saturating or supplying to fullness, or the state of being saturated; complete penetration or impregnation. Specifically—(a) In *chem.*, the combination or impregnation of one substance with another in such proportions that they neutralize each other, or till the receiving substance can contain no more. The saturation of an alkali by an acid is effected by chemical combination; the saturation of water by salt is by the process of solution. A fluid which holds in solution as much of any substance as it can dissolve is said to be saturated with it; but saturation with one substance does not deprive the fluid of its power of acting on and dissolving some other substances, and in many cases it increases this power. For example, water saturated with salt will still dissolve sugar. (b) In *physics*: (1) With respect to the presence of a vapor, a space is said to be in a state of saturation when it contains all that it can hold at that temperature; the vapor is also said to be in a state of saturation or at the dew-point (see *vapor*); it has then a maximum elastic pressure for the given temperature, and is in a state where any increase of pressure or lowering of temperature will cause it to be more or less condensed to a liquid state. (2) With respect to the presence of magnetism, a bar is said to be magnetized to saturation when a maximum of permanent magnetic force has been imparted to it, this maximum depending principally upon the material of which the bar is made.—**Saturation-equivalent**, in *chem.*, a number expressing the quantity of a standard solution required to saturate or neutralize the standard quantity of a substance, as of a fatty acid.—**Saturation of colors**, in *optics*, the degree of admixture with white, the saturation diminishing as the amount of white is increased. In other words, the highest degree of saturation belongs to a given color when in the state of greatest purity.

saturation-pressure (sat'ū-rā'shon-presh'ūr), *n.* The pressure (fixed for a given vapor at a given temperature) which is required to bring it to its maximum density.

The *saturation-pressure* of any vapour at any temperature is the same as the pressure at which the corresponding liquid boils at that temperature.

Various other etymologies, all absurd, have been suggested or are current, namely: (b) < F. *sainte terre*, holy land, in supposed allusion to "idle people who roved about the country and asked charity under pretence of going *à la sainte terre*," to the holy land. Sauria (*sä'ri-ä*), *n. pl.* [NL., < Gr. *σαῦρος*, *sauros*, a lizard: see *Saurus*.] An order of reptiles, having scales and usually legs, named by Bronn in 1799, and corresponding closely to the Linnean genus *Lacerta*; lizards. The name has been used with various extensions and restrictions of its original sense, in which it included the crocodiles and alligators as well as the true lizards or lacertilians, thus corresponding to the two modern orders *Lacertilia* and *Crocodylia*. In Cuvier's classification *Sauria* were the second order of reptiles, extended to include not only the living lizards and crocodiles, but also the extinct representatives then known of several other modern orders, as pterodactyls, ichthyosaurs, and plesiosaurs. On these accounts the term *Sauria* is discarded by many modern writers; by others it is used in a restricted sense for the lizards proper without the crocodiles, being thus an exact synonym of *Lacertilia*. This is a proper use of the name, near its original sense, and the term has priority over *Lacertilia*. The *Sauria* in this sense are about 1,500 species, representing from 20 to 25 families and numerous genera. Formerly also *Saura*, *Sauræ*.

II. *n.* A member of the *Sauria*, in any sense; a scaly reptile with legs, as a lacertilian or lizard. Though the term *Sauria* once lapsed from any definite signification, in consequence of the popular application of Cuvier's loose use of the word, *saurian* is still used as a convenient designation of reptiles which are not amphibians, chelonians, ophidians, or crocodilians. See cut under *Plesiosauros*.

saurichnite (*sä-rik'nit*), *n.* [*Also saurichnite*, < Gr. *σαῦρος*, a lizard, + *ἵκνη*, a track, footstep: see *ichnite*.] A saurian ichnolite; the fossil track of a saurian.

savory (*sav'ōrē*). As a name of a plant, it is generally applied to a woody herbaceous perennial, especially one which has a pungent or spicy flavor. The plant is a small, bushy, woody herb, with a yellowish-green color, and a strong, spicy, and somewhat bitter flavor. It is native to the mountains of the Alps, and is cultivated in gardens for use in the kitchen, and the latter is particularly valued for its flavor, which is said to be nearly the same as that of the Mediterranean *S. montana*.

saw¹ (*sā*), *n.* [*cf. ME. sawe, sawe, sawe*, *cf. AS. sawa* = *MD. sawe, sawe*, *D. zaag* = *MLG. sawe* = *OHG. sawa, sawa*, *MLG. sawe, sawe*, *G. säge* = *Lecl. saq* = *Sw. sag* = *Dan. sar, stæg*, a saw; *lit. 'a cutter'* (*cf. E. sickle*); see *secant, section*.] **1.** A cutting-tool consisting of a metal blade, band, or plate with the edge armed with cutting teeth, worked either by a reciprocating movement, as in a hand-saw, or by a continuous motion in one direction, as in a circular saw, a band-saw, and an annular saw. Saws are for the most part made of tempered steel. The teeth of the smaller kinds are formed by cutting or punch-

ing in the plate interlateral spaces or gullets. In saws of large size, a series of small, curved teeth, or a row much used. Small saws are generally provided with a single handle of hard wood. Large saws, for use by two workmen, have a handle at each end. Reciprocating saws are more generally known than the circular saw, but some are cut in both directions equally. A reciprocating saw must have, for most purposes, what is called a *set*, that is, alternate teeth must be made to project somewhat laterally and uniformly from opposite sides of the saw, so that the kerf or saw-cut may be somewhat wider than the thickness of the saw-blade. This prevents undue friction of the sides of the blade against the work. Some saws, however, as *annular saws*, *band saws*, etc., have little or no set, and the friction of the kerf is prevented by making the blades of a decreasing thickness from the edge toward the back.

2. A saw-blade together with the handles or frame to which the blade is attached, as a hand-saw, wood-saw, or hack-saw.—**3.** In *zool.* and *compar. anat.*, a serrated formation or organ, or a serrated arrangement of parts of formations or organs. (*a*) The set of teeth of a mersanser, as *Mergus serrator*. (*b*) The serrate tonal edges of the back of any bird. See *sawbill, serratorate*. (*c*) The long flat serrate or dentate snout of a saw-fish. See *cut under Pristis*. (*d*) The ovipositor of a saw-fly (*Tenthredo dimorpha*).

4. A sawing-machine, as a scroll-saw or jig-saw.—**5.** The act of sawing or saw-sawing; specifically, in *whist* [U. S.], same as *saw-saw*, 3 (*b*).—

Annular saw. (*a*) A saw having the form of a hollow cylinder or tube, with teeth formed on the end, and projecting parallel to the longitudinal axis of the cylinder, around which axis the saw is rotated when in use. Also called *barrel-saw*, *crane-saw*, *cylinder-saw*, *drum saw*, *ring-saw*, *spherical saw*, and *tub saw*. See *cut under crane saw*. (*b*) In *surgery*, a trephine.

Brier-tooth saw, a saw gulletted deeply between the teeth, the gullets being shaped in a manner which gives the teeth a curvature resembling somewhat the prickles of briars (whence the name). This form of tooth is chiefly used in circular saws, rarely or never in reciprocating saws. Also called *gullet-saw*.

Butcher's saw (named after R. G. Butcher, a Dublin surgeon), a narrow-bladed saw set in a frame so that it can be fastened at any angle; used in resections. **Circular saw,** a saw made of a circular plate or disk with a toothed edge, either formed integrally with the plate, or made by inserting removable teeth, the latter being now the most approved method for teeth of large lumber-cutting saws. Circular saws are very extensively used for manufacturing lumber, and their cutting power is enormous, some of them being over 7 feet in diameter, running with a circumferential velocity of 9,000 feet and cutting at the rate of 200 feet of kerf per minute. From the nature of this class of saws, they are exclusively used in sawing-machines. These machines, for small saws, are often driven by foot or hand-power, but more generally by steam, water, or animal-power. Plain circular saws can cut only rectilinear kerfs, but some circular saws have a dish or concavo-convex form, by which curved shapes corresponding with the shape of the saw may be cut. See *cut under rim-saw*.

Comb-cutters' saw. Same as *comb-saw*. **Cross-cut saw.** (*a*) A saw adapted by its filing and setting to cut across the grain. The teeth are filed to act more nearly like knife points than those of rip-saws, which act more like chisels. Cross-cut saws have a wider set than rip-saws. (*b*) Particularly, a saw used by lumbermen for cutting logs from tree-trunks, having an edge slightly convex in the cutting-plane, a handle at each end projecting from and at right angles with the back in the plane of the blade, and teeth filed so that the saw cuts when drawn in either direction. The main features of the apparatus are a guiding frame for holding the saw during the operation of jointing, which moves upon adjustable ways in such manner as to gage the filing of the teeth so that their points will lie in the arc of a circle of considerable radius. Saxifraga (sak-sif'ra-gä), *n.* [L. (Tournefort, 1700); see *saxifrage*.] A genus of polypetalous plants popularly known as *saxifrage*, type of the order *Saxifragaceae* and tribe *Saxifragaceae*. It is characterized by a two-celled ovary maturing into a small two-beaked and two-celled many-seeded pod, with the placenta in the axis, and by flowers with a five-lobed calyx, five equal petals, and ten stamens, with slender filaments and two-celled anthers. There are about 180 species, chiefly natives of cold regions, especially high mountains and in arctic latitudes, chiefly of the northern hemisphere, rare in South America and in Asia. They are usually perennials, with a radical rosette of broad leaves, and varying in habit from erect to prostrate, and from very smooth to glandular-hairy. Their flowers are small, but of conspicuous numbers, usually white or yellow, and panicle or corymbose. About 50 species are found in North America, nearly half of which occur also in the Old World; excluding Alaska, 30 species are known within the United States, natives especially of mountains of New England and Colorado, only 3 descending into the plains, and but 1 in the mountains south of North Carolina. They increase rapidly northward, and 25 or more are reported from Alaska, 9 of which extend to its most northern limit, Point Barrow, at 71° 27'. *S. oppositifolia*, the purple saxifrage, is perhaps the most characteristic and widely distributed plant of the arctic regions, where it is almost universal, and often the first flower to bloom, producing from four to nine pink or dark-purple petals, ranging from sea-level to 1,900 feet, and extending from northern Vermont to the farthest north yet reached, 83° 24'. See *saxifrage*.

Saxifragaceae (sak'si-frä-gä'sē-ō), *n. pl.* [NL. (A. P. de Candolle, 1830), < *Saxifraga* + *-aceae*.] An order of polypetalous plants, the saxifrage family, belonging to the cohort *Rosales* in the series *Calyciflorae*. It is closely allied to the *Rosaceae*, but with usually only five or ten stamens, and is characterized by the usual presence of regular flowers with five sepals, five petals, free and smooth filaments, two-celled anthers, a swollen or divided disk, and an ovary of two carpels, often separate above and containing numerous ovules in two rows at the central angle. It includes about 650 species in 87 genera of 6 tribes, natives of north temperate and especially of frigid regions, rare in the tropics and south temperate zone. It exhibits great variety in habit. In the shrubby genera and trees the leaves are generally opposite; in the others alternate, and often chiefly radical. Many produce valued fruits, as the currant and gooseberry; in others the fruit is a dry capsule. Many are cultivated for their ornamental flowers. See *Androsace*, *Deutzia*, *Philadelphus*, *Huechera*, and *Saxifraga* (the type of the family); also *Ribes*, *Cumula*, *Escallonia*, *Fraxinea*, the types of tribes; and, for American genera, *Itea*, *Mitella*, *Parnassia*, and *Tiarella*. of the genus *Saxifraga*. Scarcely any of the species have economic properties, but many are beautiful in foliage and flower. They are commonly rock-plants with tufted leaves and panicles of white, yellow, or red flowers. They are predominant in alpine, and of alpine plants they are the most easy to cultivate. One group, as *S. hypnoides*, has mossy foliage, forming a carpet, in spring dotted with white flowers. Others, as *S. aizoides*, have the foliage silvery, in rosettes. Others, as *S. umbrosa*, the London-pride or nose-pretty, and *S. oppositifolia*, the purple saxifrage, afford brilliant colored flowers. A leathery-leaved group is represented by the Siberian *S. crassifolia*, well known in cultivation. A common house-plant is *S. barmen-tosa*, the beefsteak or strawberry-geranium (*see* *geranium*), also called *sailor plant*, *crisp-plant*, and, Chinese *saxifraga*. *S. Of or pertaining to the later Saxons in Germany. — **Saxon architecture**, a rude variety of Romanesque, of which early examples occur in England, its period being from the conversion of England until about the Conquest, when the Norman style began to prevail. The few relics left us of this style exhibit its general characteristics as rude solidity and strength. The walls are of rough masonry, very thick, without buttresses, and sometimes of herring-bone work; the towers and pillars are thick in proportion to height, the former being sometimes not more than three diameters high; the quoins or angle-masonry are of hewn stones set alternately on end and horizontally (long and short work); the arches of doorways and windows are rounded, or sometimes these openings have triangular heads, their jambs of long and short work carrying either rudely carved imposts or capitals with square abaci. Sometimes heavy moldings run round the arches, and when two or more arches are conjoined in an arcade they are carried on heavy low shafts formed like balusters. Window-openings in the walls splay from both the interior and the exterior, the position of the windows being in the middle of the thickness of the wall. — **Saxon blue**. Basons are imitated by introducing fragments of colored stone, cutting into the stone and filling the cavities with a paste having the color of the crystals it is desired to imitate. Sometimes the stones are put upon the wall with a brush, and the cavities and defective places filled up, and this is done over and over, until the surface has attained the desired perfection; a finer polish is then given.

Sir W. R. Hamilton introduced the word with the meaning "a real number"; and it tends to confuse the subject to use a word needed for one purpose to signify something else for which no new word is needed. **Scalar of a quaternion**, a scalar which, being subtracted from the quaternion, leaves a vector as the remainder.

II. *a.* Of the nature of a scalar.—**Scalar function**. See *function*.—**Scalar operation**, an operation which, performed upon a scalar, gives a scalar.—**Scalar quantity**. See *quantity*.

Shaped like a ladder; resembling a ladder. Specifically—(a) In *entom.*, noting the venules or small cross-veins of an insect's wings when they are perpendicular to the longitudinal veins and placed at regular distances, like the rounds of a ladder. (b) In *bot.*, noting cells or vessels in which the walls are thickened in such a way as to form transverse ridges. These ridges, or alternating thick and thin places, follow each other with as much regularity as the rounds of a ladder.

2. In *conch.*, resembling or related to *Scalaria*; scalarian.—**Scalariform conjugation**, in fresh-water algae, conjugation between several cells of two different filaments, when the two lie very near one another side by side. Each cell of each filament sends out a short protuberance on the side facing the other filament. When these protuberances meet, the cell-wall becomes absorbed at the extremity of each, and an open tube is thus formed. It is the ordinary mode of conjugation in the *Mesocarpiceae*.—**Scalariform vessels**, vessels in which the walls are thickened in a scalariform manner. They are especially abundant in ferns.

Scalariidae (skal-a'ri-i-dē), *n.* pl. [*NL.*, *< Scalaria* + -idae.] A family of ptenoglossate gastropods whose type genus is *Scalaria*; the wentletraps. The species are numerous, especially in warm seas. Also *Scaliidae*, *Scalariacea*, *Scalariada*. See cut under *Scalaria*.
scalary (skā'la-ri), *a.* [*< L. scalaris*, of or pertaining to a ladder or a flight of steps; see *scalar*.] Resembling a ladder; formed with steps. [*Rare.*]

The word was used in the southern United States, during the period of reconstruction (1865 to 1870 and later), in an almost specific sense, being opprobriously applied by the opponents of the Republican party to native Southerners who acted with that party, as distinguished from *carpet-bagger*, a Republican of Northern origin. Also applied in the *Coniferae* to the leaves or bracts of the cone, and to the chaff on the stems of ferns. See also cuts under *imbricate* and *rosin-plait*. 3. In zool.,

an epidermal or exoskeletal structure that is thin, flat, hard or dry, and of some definite extent; a piece of cuticle that is squamous, scaly, or horny, and does not constitute a hair, a feather, or a horn, hood, nail, or claw; a squama; a scute; a scutellum. All these structures, however, belong to one class, and there is no absolute distinction. Scales are often of large size and great comparative thickness or solidity, and may be regarded by some as scales. These they are commonly called *shells* or *plates*. In *scaly*, one of the particular forms of epidermis which collectively form the scales, more or less complete, of fishes; a fish scale, however, of many forms and sizes, but have been classified under the four heads of *cycloid*, *rhomboid*, *placoid*, and *placoid* and fishes have been classified accordingly, as by Agassiz (see *cycloid*, etc.) They are developed on the inner side of the general epidermis, but vary greatly in form and other characteristics. In most living fishes they are expanded horny lamellae, and imbricated, the posterior edges of one transverse row overlapping adjacent parts of the succeeding row. Growth takes place from a central submedian, or posterior nucleus by increase at the periphery. Generally the anterior part, or base of insertion, is provided with striae or grooves diverging backward. (1) In numerous fishes growth takes place in layers and at the posterior edges as much as at the anterior, and there are no teeth or denticles at the posterior margin; such are called *cycloid* scales. (2) When the posterior margin is beset with denticles, a *rhomboid* scale is the result. When vestiges of such teeth or denticles are retained on the surface between the nucleus and the posterior margin, the surface is that extent *mucronated*. In other forms the growth is almost entirely sideways and forward, and the nucleus is consequently near the posterior edge. (3) Still other fishes have a hard enameled surface to the scale which is generally of a rhomboidal form, and such a scale is called *placoid*; but few modern fishes are thus armed, though scales of this kind were developed by numerous extinct forms. (4) When the scales are very small, or represented by ossified papillae of the cutis, they are called *placoid*; such are found in most of the sharks. Between these various types there are gradations, and there are also numerous modifications in other directions. The presence or absence of scales becomes also of slight systematic importance in some groups, and the same family may contain species with a scaleless body and others with scales of the cycloid and cycloid types. The scales of various fishes, as the sheephead, mullet, and drum,

are used in the manufacture of ornamental work, as mock jewelry, flower-sprays, etc. Pearl-white or essence d'orient, used in making artificial pearls, is prepared from the scales of *Alburnus lucidus* and other cyprinoid fishes. (b) In *herpet.*, one of the cuticular structures which form the skin covering of reptiles proper, as distinguished from amphibians, as a snake or lizard. These scales are commonly small, and are distinguished from the special *shields* or *plates* which cover the head, and the large specialized *gastrosterns* or *urosterns* of the under parts, as of a serpent. They are usually arranged in definite rows or series, and are also called *scales* or *scutella*. In the *Chelonia* or turtles one of the thin plates of tortoise-shell which cover the carapace is a scale. See *tortoise shell*. (c) In *ornith.* (1) A reduced feather, lacking locked barbs, and with flattened stem; as, the *scales* of a penguin. (2) A feather with metallic luster or iridescence, as those on the throat of a hummingbird. (3) A nasal opercle; a naricorne; as, the nasal scale. (4) One of the large regular divisions of the tarsal envelop; a scutellum; the smaller or irregular pieces being usually called *plates*. (d) In *mammal.*, one of the cuticular plates which may replace hairs on much of the body; as, the *scales* of a pangolin. 4. 2. A series of marks laid down at determinate distances along a line, for purposes of measurement and computation; also, the rule upon which one or more such series are laid down.—3. In music: (a) A definite and standard series of tones within some large limiting interval, like an octave, selected for artistic purposes.

The first step toward an artistic system of tones is the adoption of some interval for the division of the infinite possible range of tones into convenient sections of equal length. In Greek music, this unit of division was originally the tetrachord: in medieval music, the hexachord, and in modern music, the octave, though the octave is more or less recognized in all systems. Within the tetrachord, hexachord, or octave various scales are possible. (See *tetrachord* and *hexachord*.) The abstract method whereby the octave is divided and the succession of tones ordered within it is properly called a *mode*; but when a mode is applied at some given pitch the concrete result is called a *key* or *scale* (though *mode* and *scale* are often used interchangeably in the abstract sense). A scale is distinguished from a key in that it is used simply of the tones of the key when arranged in order of pitch. The successive tones of a scale are called *degrees*; they are usually numbered from below upward. The first tone or starting-tone is called the *key-note* or *key-tone*. The historic process of scale invention is, of course, unconscious. The selection of tones seems to be controlled primarily by an instinctive perception of their harmonic relations to the starting-tone and to each other, though limited and modified by a desire to secure an even melodic succession without too short intervals. When the smallest interval allowed is the whole step or major second, five-toned or pentatonic scales are produced, such as are used among the Chinese, in the older music of various Celtic nations, and by certain semi-civilized peoples. When the half-step or semitone is tolerated, seven-toned or heptatonic scales are produced, as in the later Greek and all modern systems. When smaller intervals than the semitone are admitted, scales of more than seven tones are produced, as among the Hindus, the Persians, and other Orientals. In modern European music two chief forms of scale are used, the *major* and the *minor*, the latter having three varieties. (See *mode*), 7 (a) (3.) Both forms are termed *diatonic*. When, for purposes of modulation or of melodic variety, other intermediate tones are added, they are called *chromatic tones*, and a scale in which all the longer steps of a diatonic scale are divided by such intermediate tones is a *chromatic scale*, containing eleven tones in all. (See *chromatic*.) Properly an upward chromatic scale for melodic purposes differs from a downward, but on the keyboard they are assumed to be equivalent. In written music, a scale noted in both sharps and flats, so as to include the nominal constituents of both an upward and a downward chromatic scale, is called an *enharmonic scale*. A chromatic scale for harmonic purposes includes, in addition to the tones of the usual diatonic major scale, a minor second, a minor third, an augmented fourth, a minor sixth, and a minor seventh. When a scale of either kind is made up of tones having exact harmonic relations with the key-note, it is called *exact* or *pure*; but the compromise construction of the keyboard reduces all scales to an arbitrary form, called *tempered*. In solmization, the tones of a scale are represented by the syllables *do, re, mi*, etc. (See *interval*, *keyboard*, *solmization*, and *temperament*.) (b) Any particular scale based upon a given key-note: as, the *scale* of G or of F. Unless otherwise qualified, such a scale is understood to be a major scale. All major scales are essentially similar, except in pitch; all minor scales also. On the keyboard, however, there is considerable mechanical difference on account of the varying succession of the white and black digitals. (See *key*, 7.) (c) Of a voice or an instrument, same as *compass*, 5. (d) In an organ-pipe, the ratio between its width and its length: a broad scale producing full, sonorous tones, as in the open diapason; and a narrow scale, thin, string-like tones, as in the dulciana. The same usage occurs occasionally in connection with other instruments, referring to size in relation to the quality of the tones produced.

4. Succession of ascending or descending steps or degrees; progressive series; scheme of comparative rank or order; gradation.

There is in this universe a stair, or manifest *scale*, of creatures, rising not disorderly, or in confusion, but with a comely method and proportion.

5. A system of proportion by which definite magnitudes represent definite magnitudes, in a sculpture, picture, map, and the like; also, a system of proportion for taxation or other purpose.

Irving, Knickerbocker, p. 149.

Knight*.—**Wind-scale**, a number of descriptive terms systematically arranged for use in estimating the force of the wind. Scales of four, six, seven, ten, and twelve terms have been used by different meteorological services. Seamen of all nations have very generally adopted the Beaufort scale, introduced into the British navy by Admiral Beaufort in 1805. This is a scale of twelve terms, as follows: 1, light air; 2, light breeze; 3, gentle breeze; 4, moderate breeze; 5, fresh breeze; 6, strong breeze; 7, moderate gale; 8, fresh gale; 9, strong gale; 10, whole gale; 11, storm; 12, hurricane.

Many noted pests to agriculture belong to this group, such as the May-beetles or June-bugs and cockchafer of America and Europe, the *Anisoplia austriaca* of the Russian wheat-fields, and the rose-chaffer and fig-eater of the United States. Scarabæus (skar-a-bē'us), *n.* [Also *Scarabæus*; NL. (Linnaeus, 1767), *<* L. *scarabæus*, a beetle; see *scarab*.] 1. They are coprophagous in habit, the adults rolling up balls of excrement in which the females lay their eggs. The sacred scarab of the Egyptians is *S. sacer*, found throughout the countries bordering on the Mediterranean. It is probable also that another species, *S. laticollis*, was held in religious veneration by the Egyptians, as the scarab is sometimes figured by them with striate elytra, a character which pertains to this alone. Species of *Ateuchus*, as *A. pius*, were formerly included in this genus.

The physical use in MD. *schaers afscheren*, shear off close, shave close, It. *cogliere scarso*, strike close, graze (see *scarce*, adv.), *scarsare*, cut off, pinch, scant (see *scarce*, v.), suggests some confusion with MD. *schaers*, a pair of shears, also a plowshare, and the orig. verb *scheeren*, shear (see *shear*, *shears*, *share*). schema (skē'mā), *n.*; pl. *schemata* (-mā-tā). [*L. schema*, < Gr. *σχῆμα*, shape, figure, form: see *scheme*.] 1. A diagram, or graphical representation, of certain relations of a system of things, without any pretense to the correct representation of them in other respects; in the *Kantian philos.*, a product of the imagination intermediate between an image and a concept, being intuitive, and so capable of being observed, like the former, and general or quasi-general, like the latter.

The *schema* by itself is no doubt a product of the imagination only, but as the synthesis of the imagination does not aim at a single intuition, but at some kind of unity alone in the determination of the sensibility, the *schema* ought to be distinguished from the image. Thus, if I place

five points, one after the other, . . . , this is an image of the number five. If, on the contrary, I think of a number in general, whether it be five or a hundred, this thinking is rather the representation of a method of representing in one image a certain quantity (for instance, a thousand) according to a certain concept, than the image itself, which, in the case of a thousand, I could hardly take in and compare with the concept. This representation of a general procedure of the imagination by which a concept receives the image I call the *schema* of such a concept.

Kant, Critique of Pure Reason, tr. by Max Muller, p. 140.

2. *Scheme*; plan; outline; formerly, a geometrical diagram.—3. In *logic*, a figure of syllogism.—4. In *anc. gram.* and *rhet.*, a figure; a peculiar construction or mode of expression.—5. Transcendental schema, the pure and general sensualization of a concept of the understanding a priori.

schematic (skē-mat'ik), *a.* [*Gr. σχημα* (-mā-), shape, form (see *scheme*), + *-ic*.] Of the nature of, or pertaining to, a schema, in any sense; typical; made or done according to some fundamental plan: used in biology in much the same sense as *archetypal*.

If our system of notation be complete, we must possess not only one notation capable of representing . . . syllogisms of every figure and of no figure, but another which shall at once and in the same diagram exhibit every syllogistic mode, apart from all *schematic* differences, be they positive, be they negative.

Sir W. Hamilton, Discussions, App. II. (B).

In *astrol.*, the combination of the aspects of heavenly bodies.—2. Particular form or disposition of a thing; an exhibition in outline of any systematic arrangements; outline. [Rare.]

Every particle of matter, whatever form or *schematism* it puts on, must in all conditions be equally extended, and therefore take up the same room.

Creech.

3. A system of schemata; a method of employing schemata.

We have seen that the only way in which objects can be given to us consists in a modification of our sensibility, and that pure concepts a priori must contain, besides the function of the understanding in the category itself, formal conditions a priori of sensibility (particularly of the internal sense) which form the general condition under which alone the category may be applied to any object. We call this formal and pure condition of the sensibility, to which the concept of the understanding is restricted in its application, its *schema*; and the function of the understanding in these schemata, the *schematism* of the pure understanding.

Kant, Critique of Pure Reason, tr. by Max Muller, p. 140.

4. In *logic*, the division of syllogism into figures.

schematist (skē-mā-tist), *n.* [*Gr. σχημα* (-mā-), form, shape, figure (see *scheme*), + *-ist*.] One given to forming schemes; a projector.

schematize (skē-mā-tiz), *v.*; pret. and pp. *schematized*, ppr. *schematizing*. [*Gr. σχηματίζω*, form, shape, arrange, < *σχῆμα*, form, shape: see *scheme*.] 1. *trans.* To form into a scheme or schemes; arrange in outline.

II. *intrans.* 1. To form a scheme or schemes; make a plan in outline.—2. To think by means of a schema in the Kantian sense.

schism (sizm), *n.* [Early mod. E. also *scism*; < ME. *scisma*, later *schisma*, < OF. *scisma*, *cisma*, *F. schisme* = Pr. *scisma*, *sisma* = Sp. *cisma* = Pg. *schisma* = It. *scisma*, < L. *schisma*, < Gr. *σχίσμα*, a cleft, split, schism, < *σχίζω*, cleave, split. = L. *scindere* (√ *scad*), cut. = Skt. √ *chid*, cut. Cf. *schist*, *scull*, *abscond*, *rescind*, etc., and *schedule*, etc.] 1. Division or separation; specifically, in ecclesiastical usage, a formal separation within or from an existing church or religious body, on account of some difference of opinion with regard to matters of faith or discipline.

Schism is a rent or division in the church when it comes to the separating of congregations. Milton, True Religion.

Attraction is the most general law in the material world, and prevents a *schism* in the universe.

Theodore Parker, Ten Sermons on Religion.

2. The offense of seeking to produce a division in a church. In the authorized version of the New Testament the word *schism* occurs but once (1 Cor. xii. 25); but in the Greek Testament the Greek word *σχίσμα* occurs eight times, being rendered in the English version 'rent' (Mat. ix. 16) and 'division' (John vii. 43; 1 Cor. xi. 18). From the simple meaning of division in the church the word has come to indicate a separation from the church, and now in ecclesiastical usage is employed solely to indicate a formal withdrawal from the church and the formation of or the uniting with a new organization. See def. 1.

From all false doctrine, heresy, and *schism*, . . . Good Lord, deliver us. Book of Common Prayer, Litany.

3. A schismatic body.

They doo therefore with a more constante mynde persener in theyr fyrst fayth which they receaved . . . than doo manye of vs, beinge diuided into *scismes* and sectes, whiche thyngne neuer chaunceth amonge them.

R. Eden, tr. of John Faber (First Books on America, ed. Arber, p. 290).

That Church that from the name of a distinct place takes authority to set up a distinct Faith or Government is a *Scism* and Faction, not a Church.

Milton, Eikonoklastes, xxvii.

Great schism. See *great*—*Schism Act*, or *Schism Bill*, in *Eng. hist.*, an act of Parliament of 1713 (12 Anne, stat. 2, c. 7), "to prevent the growth of schism and for the further security of the churches of England and Ireland as by law established." It required teachers to conform to the established church, and refrain from attending dissenting places of worship. The act was repealed by 5 Geo. I., c. 4.

schisma (skis'mä), *n.*; pl. *schismata* (-mä-tä-). [< L. *schisma*, < Gr. *σχίσμα*, separation; see *schism*.] In musical acoustics, the interval between the octave of a given tone and the third of the eighth fifth, less four octaves, represented by the ratio $2:3^{\frac{1}{2}} = 2^{11}:3^7$, or 32805:32768. This corresponds almost exactly to the difference between a pure and an equally tempered fifth, which difference is hence often called a *schisma*. A schisma and a diachisma together make a syntonic comma.

schismatic (siz-mat'ik), *a.* and *n.* [Formerly also *scismatic*; < OF. (and F.) *schismatique* = Pr. *sismatic* = Sp. *cismatico* = Pg. *schismatico* = It. *schismatico*, < LL. *schismaticus*, < Gr. *σχισματικός*, schismatic, < *σχίσμα* (-), a cleft, split, schism; see *schism*.] 1. *a.* Pertaining to, of the nature of, or characterized by schism; tending or inclined to or promotive of schism: as, *schismatic* opinions; a *schismatic* tendency.

In the great schism of the Western Church, in which the Churches of the West were for forty years nearly equally divided, each party was by the other regarded as *schismatic*, yet we cannot doubt that each belonged to the true Church of Christ. Pusey, Eirenicon, p. 67.

II. *n.* One who separates from an existing church or religious faith on account of a difference in opinion; one who partakes in a schism. See *schism*.

As much beggarly logic and earnestness as was ever heard to proceed from the mouth of the most pertinacious *schismatic*. I. Walton, Complete Angler, p. 113.

Dr. Pierce preach'd at White-hall on 2 Thessal. ch. 3, v. 6. against our late *schismatics*. Evelyn, Diary, Feb. 22, 1678.

Gray, 1821), as *Chismatobranchia*, < Gr. *σχίσμα* (-), cleft, + *βράγχια*, gills; see *branchiae*.] A suborder of rhypidoglossate gastropods, with the gills in two plumes on the left side of the gill-cavity on each side of the mantle-slit, the body and shell spiral, the foot fringed and bearded, the eyes pedicelled, and the central teeth of the odontophore very large and sessile. It was defined by Gray, for the families *Halitidae* and *Scissurellidae*, as one of 9 orders into which he divided his cryptobranchiate gastropods.

See cuts under *angler*, *Balistes*, and *Chimæridæ*.

schist (shist), *n.* [< F. *schiste*, < L. *schistos*, split, cleft, divided, < Gr. *σχίστός*, easily cleft, < *σχίζω*, cleave; see *schism*.] A rock the constituent minerals of which have assumed a position in more or less closely parallel layers or folia, due not to deposition as a sediment, but—in large part, at least—to metamorphic action, which has caused a rearrangement or imperfect crystallization of the component minerals, or the formation of new ones, these, in the course of the process, having assumed

the parallel arrangement characteristic of the rock. *Schist* and *slate* are not essentially different terms; but of late years the latter has been chiefly employed to designate a fine-grained argillaceous rock divided into thin layers by cleavage-planes, and familiar in its use for roofing; while the word *schist* is generally employed in composition with a word indicating the peculiar mineral species of which the rock is chiefly made up, and which by its more or less complete foliation gives rise to the schistose structure: thus, *hornblende-schist*, *chlorite-schist*, *mica-schist*, etc.—all included under the general designation of *crystalline schists*, among which argillaceous schist also belongs, and from which it is separated only because its fissility is, as a general rule, more perfect than that of the other schists, and because it is for this reason of much practical importance, especially in its application to building. Also spelled *schist*. Knotted schist. Same as *knotted schist*. —Protozoic schists. See *protzoic*.

Schistoprosopus (skis'tō-prō-sō'pus), *n.*; pl. *Schistoprosopi* (-pi). [NL., < Gr. *σχίστός*, cloven, + *πρόσωπον*, face.] In *teratol.*, a monster whose face is fissured.

Schistose, **schistous** (shis'tōs, -tus), *a.* [< *schist* + *-ose*, *-ous*.] Having the structure of schist; resembling schist, or made up of a rock so designated. A schistose structure differs from that resulting from sedimentation in that the former bears the marks of chemical action in the more or less complete interlacing or felting of the component particles, and in the continual breaks or want of continuity of the lamina, while in the latter the particles are only held together by some cement differing from them in composition, or even by pressure alone, and are arranged in a more distinctly parallel order than is usually the case with the schists. In rocks in which a slaty cleavage is very highly developed, as in roofing-slate, this cleavage is almost always quite distinct from and independent in position of the lines of stratification, and this fact can ordinarily be recognized with ease in the field. There are cases, however, in which a schistose structure has been developed in a mass of rock parallel with the planes of stratification. Also spelled *schistose*, *schistous*.

Schistosity (shis-tōs'i-ti), *n.* [< *schistose* + *-ity*.] The condition of being schistose, or of having a schistose structure.

They are annual plants with very tender and delicate stems which are of two forms. The "flowers" are terminal, loosely gemmiform, producing a small subglobose capsule on a long soft pedicel. The calyptra is minute, narrowly nitroform, covering the lid only. There is no peristome.

schizocoelous (ski-zō-sē'lūs), *a.* [*schizo*, to
 cleave, split, + *coel*, the pangs of labor.] Re-
 producing or bringing forth by rupture; noting
 the way in which mollusks without nephridia
 may be supposed to extrude their genital pro-
 ducts; correlated with *adudine* and *porodine*.

The arrangement in Patella, etc., is to be looked upon
 as a special development from the simpler condition when
 the Mollusca brought forth by rupture (= *schizodine*,
 from *schizo*, to cleave, split, + *dine*, to produce, to
 bring forth).

E. R. Lankester, Encyc. Brit., XVI. 682.

Schizodon (ski-zō'don), *n.* [NL. (Waterhouse,
 1841), *schizo*, to cleave, split, + *odon* (*odont*),
 tooth.] A genus of South American octodont
 rodents, related to *Ctenomys*, but with larger

ears, smaller claws, less massive skull, broad
 convex incisors, and molars with single external
 and internal folds, which meet in the middle of
 the tooth. *S. fuscus* is the species.

schizogenesis (ski-zō-jen'e-sis), *n.* [NL., *schizo*,
 to cleave, split, + *genesis*, production.] In
 bot., fission as a mode of reproduction; genera-
 tion by fission. *Haeckel*.

schizogenetic (ski-zō-jē-net'ik), *a.* [*schizo*,
 to cleave, split, + *genesis*, production.] In
 bot., same as *schizogenic*.

schizogenic (ski-zō-jen'ik), *a.* [*schizo*, to
 cleave, split, + *genesis*, production (see *-gen*), +
-ic.] In bot., produced by splitting or separa-
 tion: applied to cavities or intercellular spaces
 in plants that are formed by the separation or
 unequal growth of contiguous cells, leaving
 an interspace. Compare *lysigenous*, *protogenic*,
hysterogenic.

schizogenous (ski-zō-jē-nus), *a.* [As *schizo*,
 to cleave, split, + *genesis*, production.] In bot.,
 same as *schizogenic*.

schizognath (ski-zō-gnath), *n.* and *a.* I. *n.* A
 schizognathous bird.

II. *a.* Schizognathous.

Schizognathæ (ski-zō-gnā-thē), *n. pl.* [NL.,
 fem. pl. of *schizognathus*; see *schizognathous*.]
 In ornith., in Huxley's classification (1867), one
 of four primary divisions of carinate birds, em-
 bracing all those which exhibit schizognathism,
 or have the palate schizognathous. The division
 includes a number of superfamily groups—the *Perisora-*
morphae, *Alcedoromorphae*, *Spheniscomorphae*, *Cecropi-*
omorphae, *Geranomorphae*, and *Charadriomorphae*, or the pigeons,
 fowls, penguins, gulls and their allies, cranes and their al-
 lies, and plovers and snipes and their allies.

schizognathism (ski-zō-gnā-thizm), *n.* [*schizo*,
 to cleave, split, + *gnath*, jaw.] In ornith., the schizo-
 gnathous type or plan of palatal structure; the
 peculiar arrangement of the palatal bones ex-
 hibited by the *Schizognathæ*.

Schizognathism is the kind of "cleft palate" shown by
 the columbine and gallinaceous birds, by the waders at
 large, and by many of the swimmers.

Coues, Key to N. A. Birds, p. 179.

Schizognathous (ski-zō-gnā-thus), *a.* [*schizo*,
 to cleave, split, + *gnath*, jaw.] In ornith., having the bony palate
 cleft in such a way that in the dry skull the
 blade of a thin knife can be passed without
 meeting with any bony obstacle from the poste-

rior nares alongside the vomer to the end of
 the beak" (*Huxley*); exhibiting schizognathism
 in the structure of the
 bony palate: as, a *schizo*-
gnathous bird; a *schizo*-
gnathous palate; a *schizo*-
gnathous type of palatal
 structure. The vomer, whether
 large or small, tapers to a
 point in front, while behind it
 embraces the basisphenoidal rostrum,
 between the palatines;
 these bones and the pterygoids
 are directly articulated with one
 another and with the basisphe-
 noidal rostrum, not being borne
 upon the divergent posterior
 ends of the vomer; the maxillo-
 palatines, usually elongated and
 lamellar, pass inward over the
 anterior ends of the palatines,
 with which they unite, and then
 bend backward, along the inner
 ends of the palatines, leaving a
 broader or narrower fissure be-
 tween themselves and the vomer, on each side, and do not
 unite with one another or with the vomer.

schizogony (ski-zō-gō-ni), *n.* [*schizo*, to
 cleave, split, + *gony*, generation: see *-gony*.]
 Same as *schizogony*.

Schizogony having once been established, it must have
 been further beneficial to the species.

A. A. W. Hubrecht, Micros. Science, XXVII. 613.

schizomycete (ski-zō-mi-sē'tē), *n.* A member of
 the *Schizomycetes*.

Schizomycetes (ski-zō-mi-sē'tēz), *n. pl.* [NL.,
schizo, to cleave, split, + *mykes*, *pl. myketes*,
 a fungus, mushroom: see *Myces*.] A class
 or group of minute vegetable organisms known
 as bacteria, microbes, microphytes, etc., and
 allied forms, belonging to the achlorophyl-
 lous division of the *Schizosporæ* of Cohn (the
Schizophyta of later authorities), or to the *Pro-*
tophyta of still more recent authors. They were
 at first regarded as being simple fungi, and hence
 are sometimes still called *fission fungi*, but recent in-
 vestigations indicate that they are more closely allied to the
Schizophyceæ or lower algae than to the true fungi. They
 are probably degenerate algae, a condition which has been
 brought about by their saprophytic or parasitic habits.
 They consist of single cells which may be spherical, ob-
 long, or cylindrical in shape, or of filamentous or various
 other aggregations of such cells. The cells are com-
 monly about 0.001 millimeter in diameter, or from two to
 five times that measurement; but smaller and a few larger
 ones are known. They are, with one or two exceptions,
 destitute of chlorophyll, and multiply by repeated bi-
 partitions. True spores are known in several forms, but
 no traces of sexual organs exist. They are saprophytic or
 parasitic, and occur the world over as saprophytes. They
 abound in running streams and rivers, in still ponds and
 ditches; in the sea, in bogs, drains, and refuse-heaps; in
 the soil, and wherever organic infusions are allowed to
 stand; in liquids containing organic matter, as blood,
 milk, wine, etc.; and on solid food-stuff, such as meat,
 vegetables, preserves, etc. As parasites, numerous species
 inhabit various organs of men and animals, causing
 most of the infectious diseases, as tuberculosis, typhoid
 fever, cholera, etc. Plants are subject to their attack to
 a more limited degree, a circumstance that is probably
 due to the acid fluids of the higher vegetable organisms.
 Schizomycetes vary to a considerable extent according
 to the conditions of their environment, and hence many
 growth-forms occur which have frequently received differ-
 ent generic names. The round growth-forms are called
Coccus or *Micrococcus*; the rod-like forms have been ter-
 med *Bacillus*, *Bacterium*, etc.; the shortly coiled forms
 are known as *Vibrio*; the spiral forms have received the names
Spirillum or *Spirochæta*; and the very elongated filiform
 ones are *Leptothrix*, etc. Their behavior with reference
 to the supply or exclusion of oxygen has led to their divi-
 sion by Pasteur into *aerobiotic*, or such as require a plenti-
 full supply of free oxygen for the purpose of vegetation,
 and *anaerobiotic*, or those in which vegetation is pro-
 moted by the exclusion of oxygen, or at least is possible
 when oxygen is excluded. There are, however, various
 intermediate forms. See *entophyte*, *Fungi*, *Protophyta*,
Bacteriæ, *Bacterium*, *Micrococcus*, *Leptothrix*, *Bacillus*,
Spirillum, *Spirochæta*, *Vibrio*.

schizomycetous (ski-zō-mi-sē'tūs), *a.* In bot.,

schizomycosis (ski-zō-mi-kō'sis), *n.* [NL., as
Schizomycetes + *-osis*.] Disease due to the
 growth of *Schizomycetes* in the body.

Schizonemertea (ski-zō-nē-mēr'tē-ā), *n. pl.* [NL.,
schizo, to cleave, split, + *nemertea*, *nemertea*,
 a worm, v. q.] Hubrecht's name (1879) of a division
 of nemertean worms, correlated with *Hoplone-*
mertea and *Palgonemertea*, containing the sea-
 longworms which have the head fissured,
 the mouth behind the ganglia, and no stylets in
 the proboscis, as *Lineus*, *Cerebratulus*, *Langia*,
 and *Bolusia*.

 sea-longworm.

Also *schizonemertine*.

 nem-er-ti-nā, -ni), *n. pl.* [NL., *schizo*, to

Schizoneura (skiz-ō-nū'rā), *n.* [NL. (Hartig, 1840), < Gr. *σχίζω*, cleave, split, + *νεύρα*, nerve.] A notable genus of plant-lice of the subfamily *Pemphiginae*, having the antennae six-jointed, the third discoidal vein of the fore wings with one fork, and the hind wings with two oblique veins. The genus is cosmopolitan and contains many species, nearly all of which excrete an abundance of flocculent or powdery white wax. Many live upon

the roots of trees, and others upon the limbs and leaves. The best-known species is *S. lanigera*, known in the United States as the woolly root-lice of the apple, and in England, New Zealand, and Australia as the American blight. See also cuts under *root-lice*.

schizopelmous (skiz-ō-pel'mus), *a.* [< Gr. *σχίζω*, cleave, split, + *πέλος*, the sole of the foot.] In *ornith.*, same as *monopelmous*.

Schizophora (ski-zof'ō-rā), *n.* *pl.* [NL., < Gr. *σχίζω*, cleave, split, + *φορος*, < *φέρω* = E. bear¹.] In Brauer's classification, a division of cyclotheraphous dipterous insects, or flies, containing the pupiparous flies of the families *Hippoboscidae* and *Nycteribiidae*, as well as all of the *Muscidae* (in a broad sense): contrasted with *Aschiza*.

Schizophyceae (skiz-ō-fi'sē-ē), *n. pl.* [NL., < Gr. *σχίζω*, cleave, split, + *φυκω*, a seaweed, + *-εα*.] A group of minute cryptogamous plants belonging, according to recent authorities, to the *Protophyta*, or lowest division of the vegetable kingdom. It is a somewhat heterogeneous group, comprising the greater number of the forms of vegetable life which are unicellular, which display no true process of sexual reproduction, and which contain chlorophyll. The group (which future research may distribute otherwise) embraces the classes *Protozoceae*, *Diatomeae*, and *Cytophyceae*. See *Protophyta*.

Schizophytæ (ski-zof'i-tē), *n. pl.* [NL., < Gr. *σχίζω*, cleave, split, + *φύτον*, a plant.] Usually, the same as the *Schizomycetes*, but of varying application. See *Schizomycetes*.

schizopod (ski-zō-pod), *a.* and *n.* [NL. *schizopod*, < Gr. *σχίζω* (=*σχίζω*), with cleft feet, < *σχίζω*, cleave, split, + *ποῖς* (=*ποδ*) = E. foot.] I. *a.* Having the feet cleft and apparently double, as an opossum-shrimp; specifically, of or pertaining to the *Schizopoda*.

II. *n.* A member of the *Schizopoda*, as an opossum-shrimp.

Schizopoda (ski-zop'ō-dā), *n. pl.* [NL., neut. pl. of *Schizopus*: see *Schizopod*.] 1. An Aristotelian group of birds, approximately equivalent to the Linnean *Grallæ*, or waders.—2. A suborder or similar group of long-tailed stalk-eyed crustaceans, having a small cephalothorax, a large abdomen, and the pereopods or thoracic legs apparently cleft or double by reason of the great development of exopodites, which are as large as the endopodites. It includes the opossum-shrimps and their allies. See *Mysidæ*, and cut under *opossum-shrimp*. Latreille, 1817.

schizopodal (ski-zop'ō-dal), *a.* [< *schizopod* + *-al*.] Same as *schizopod*.

Schizopodidæ (skiz-ō-pod'i-dē), *n. pl.* [NL., < *Schizopoda* + *-idæ*.] A family of *Coleoptera* named by Le Conte (1861) from the genus *Schizopoda*, now merged in *Buprestidæ*.

schizopodous (ski-zop'ō-dus), *a.* [< *schizopod* + *-ous*.] Same as *schizopod*.

schizopod-stage (ski-zō-pod-stāj), *n.* A stage in the development of some of the stalk-eyed crustaceans, as a prawn (*Penæus*), when the larva resembles an adult schizopod.

The greatly enlarged thoracic limbs are provided with an endopodite and an exopodite as in the *Schizopoda*, the branchiæ are developed from them, and the abdominal appendages make their appearance. This may be termed the *schizopod-stage*.

Huxley, *Anat. Invert.*, p. 301.

Schizopteris (ski-zop'tē-ris), *n.* [NL., < Gr. *σχίζω*, cleave, split, + *πτερίς*, a wing, a kind of fern: see *Pteris*.] A generic name given by Brongniart to a fossil plant found in the coal-measures of the coal-field of the Saar and in Saxony, and supposed to belong to the ferns. The genus is now included in *Rhacophyllum*, but of this genus (as well as of the plants formerly called *Schizopteris*) little is definitely known.

Schizorhinæ (skiz-ō-rī'nē), *n. pl.* [NL.: see *schizorhinal*.] Schizorhinal birds collectively. A. H. Garrod.

schizorhinal (skiz-ō-rī-nal), *a.* [< Gr. *σχίζω*, cleave, split, + *ῥίνα* (=*ῥίνα*), the nose, + *-al*.]

In *ornith.*, having each nasal bone deeply cleft or forked: opposed to *holorhinal*. The term denotes the condition of the nasal bone on each side (right and left), and not the separateness of the two nasal bones, which it has been misunderstood to mean. By a further mistake, it has been made to mean a slit-like character of the external nostrils, with which it has nothing to do.

In the *Columbidae*, and in a great many wading and swimming birds, whose palates are cleft (schizognathous), the nasal bones are *schizorhinal*: that is, cleft to or beyond the ends of the premaxillaries, such fission leaving the external descending process very distinct from the other, almost like a separate bone. Pigeons, gulls, plovers, cranes, auks, and other birds are thus split-nosed. Coues, *Key to N. A. Birds*, p. 165.

Schizosiphona (skiz-ō-sī'fō-nā), *n. pl.* [NL., < Gr. *σχίζω*, split, cleave, + *σφών*, tube, pipe.] An order of *Cephalopoda*, named from the split siphon, the edges of the mesopodium coming into apposition but not coalescing: opposed to *Holosiphona*: a synonym of *Tetrabranchiata*.

schizosiphonate (skiz-ō-sī'fō-nāt), *a.* [As *Schizosiphona* + *-ate*.] Having cleft or split siphons; specifically, of or pertaining to the *Schizosiphonæ*.

Schizostachyum (skiz-ō-stak'i-um), *n.* [NL. (Nees, 1829), < Gr. *σχίζω*, cleave, split, + *στάχυς*, a spike.] A genus of grasses of the tribe *Bambuseæ* and subtribe *Melocanneæ*. It is characterized by spikelets in scattered clusters forming a spike or panicle with numerous empty lower glumes, and bisexual flowers with two or three lodicules, six stamens, three elongated styles, and a pedicel continued beyond the flowers. There are about 8 species, natives of the Malay archipelago, China, and the Pacific islands. They are tall and arborescent grasses, resembling the bamboo in habit and leaf. Several species reach 25 to 40 feet or more in height, and several are cultivated for ornament or for culinary use, the young shoots being eaten in Java and elsewhere under the name of *rebong*.

Schizotarsia (skiz-ō-tār'si-ā), *n. pl.* [NL., < Gr. *σχίζω*, cleave, split, + *τάρος*, any broad, flat surface: see *tarsus*.] A family, tribe, or suborder of centipeds, represented by the family *Cermatiidæ*. See cut under *Scutigera*.

schizothecal (skiz-ō-thē'kal), *a.* [< Gr. *σχίζω*, cleave, split, + *θηκα*, case, + *-al*.] In *ornith.*, having the tarsal envelop, or podotheca, divided by scutellation or reticulation: the opposite of *holothecal*.

Schizotrocha (ski-zot'rō-kā), *n. pl.* [NL., neut. pl. of *schizotrochus*: see *schizotrochous*.] One of the major divisions of *Rotifera*, containing those wheel-animalcules which have

an intestine and anus and one divided disk, whence the name: correlated with *Holotrocha* and *Zygotrocha*.

schizotrochous (ski-zot'rō-kus), *a.* [< NL. *schizotrochus*, < Gr. *σχίζω*, cleave, split, + *τροχός*, a wheel.] Having a divided disk, as a rotifer; of or pertaining to the *Schizotrocha*; neither holotrochous nor zygotrochous.

schläger (shlā'gēr), *n.* [G., < *schlagen*, beat, strike, = E. *slay*: see *slay*, *slayer*.] The modern dueling-sword of German university students. The blade is about 3 feet long and without point, the end being cut square off; each edge is very sharp for a few inches from the end of the blade. It is used with a sweeping blow around the adversary's guard, so as to cut the head or face with the sharpened corner. The schläger has a heavy basket-hilt completely protecting the hand. A heavy gauntlet of leather covers the arm to the elbow. The usual guard is by holding the blade nearly vertical, pommel uppermost, the hand just above the level of the eyes.

Schlegelia (shle-gē'li-ā), *n.* [NL. (Bernstein, 1864), so called after Hermann Schlegel, an ornithologist of Leyden (1805-84).] A genus of birds of paradise. The species is *S. wilsoni*, better known as *Paradisaea* or *Uiphodites wilsoni* of Waugliou and Batanta. The male is 7½ inches long, the tail 2, with its middle pair of feathers as long again, twice crossed and then curled in arietiform figure. The bald head

Schlegelia wilsoni

is bright blue, the fore back is rich yellow, the rest lustrous crimson; the breastplate is mostly glittering green, and other parts of the plumage are of varied and scarcely less burnished hues. The female is somewhat smaller, and in plumage unlike the male, as usual in this family. The species has several technical synonyms. Professor Schlegel called it *Paradisaea calva*, but not till after Mr. Cassin of Philadelphia had dedicated it to Dr. T. B. Wilson of that city. Mr. Elliot, the monographer of the *Paradisæideæ*, has it *Diphyllodes respublica*, after a mistaken identification made by Dr. Sclater of a bird very inadequately characterized by Prince Bonaparte, which belongs to another genus.

Schleichera (shli-kēr-ā), *n.* [NL. (Willdenow, 1805), named after J. C. Schleicher, a Swiss botanist, author (1800) of a Swiss flora.] A genus of plants of the order *Sapindaceæ*, type of the tribe *Schleicheæ*. It is characterized by apetalous flowers with a small calyx of four to six uniform and valvate lobes, a complete and repand disk, six to eight long stamens, and an ovary with three or four cells and solitary ovules, becoming a dry and indehiscent one to three-celled ovoid and undivided fruit, containing a pulpy and edible aril about the black top-shaped seed. The only species, *S. trijuga*, is a native of India, Ceylon, and Burma, especially abundant in Pegu, sometimes called *lac-tree*, and known in India as *kosumbia*. It is a large hardwood tree with alternate and abruptly pinnate leaves, usually of three pairs of leaflets, and with small long-pediced flowers in slender racemes. Its timber is very strong, solid, and durable. In India and Ceylon it is valued as one of the trees frequented by the lac-insect (see *lac*), and its young branches form an important source of shellac. The oil pressed from its seeds is there used for burning in lamps and as a remedy for the itch.

Schleicherææ (shli-kēr-ē-ē), *n. pl.* [NL. (Radlkofer, 1888), < *Schleichera* + *-ææ*.] A tribe of dicotyledonous plants of the order *Sapindaceæ* and suborder *Sapindææ*, typified by the monotypic genus *Schleichera*, and containing also 3 other species in 2 genera, natives of tropical Africa and Madeira.

Schlemm's canal. See *canal of Schlemm*, under *canal*.

schlich (shlik), *n.* See *slick*.

Schloss Johannisberger. The highest grade of Johannisberger, produced on the home estate of Prince Metternich.

schmelze (shmel'tse), *n.* [G. *schmelz*, enamel: see *smelt*, *smalt*, *amel*, and *enamel*.] Glass of some peculiar sort used in decorative work: a word differently used by different writers. (a) Glass especially prepared to receive a deep-red color, and used when colored for flashing white glass. This is the common form of red glass prepared for ornamental windows. (b) Mosaic glass or flint-glass of any sort.

and independent developments, the one prevents the other subsequent to the discovery of the Aristotelian works of Aristotle in the last part of the twelfth century. Scholasticism should be considered as arising about A.D. 1000, and is separated by a period of silence from the few writers between the cessation of the Roman schools and the lowest ebb of thought (such as Isidore, Bede, Gerbert, writers directly or indirectly under Arabian influence, Scotus Erigena and other Irish monks, the English Alcuin, with his pupil Frigidus, etc.), writers marked by great ignorance, by a strong tendency to materialize abstractions, by a disposition to adopt opinions arbitrarily, but also by a certain freedom of thought. The first era of scholasticism was occupied by disputes concerning nominalism and realism. It naturally falls into two periods, since the disputants of the eleventh century took simple and extreme ground on one side or the other, the nominalistic rationalist Berengarius being opposed by the realistic prelate Lanfranc, the Platonizing nominalist Roscelin by the mystical realist Anselm; while in the twelfth century the opinions were sophisticated by distinctions until they cease to be readily classified as nominalistic and realistic. The scholastics of the latter period included Peter Abelard (1079-1142); Gilbert of Poitiers (died 1154), one of the few writers of the twelfth century ever quoted in the thirteenth; Peter Lombard (died 1164), compiler of the four books of "Sentences," or opinions of the fathers, which was the peg on which much later speculation was hung as commentary; and John of Salisbury (died 1180), an elegant and readable author. For more than a generation after his death the schoolmen were occupied with studying the works of Aristotle and the Arabians, without producing anything of their own. Then began the second era of scholasticism, and this divides itself into three periods. During the first, which extended to the last quarter of the thirteenth century, Alexander of Hales (died 1245), Albertus Magnus (1193-1280), and St. Thomas Aquinas (died 1274) set up the general framework of the scholastic philosophy, while Petrus Hispanus (perhaps identical with Pope John XXI., who died 1277) wrote the standard text-book of logic for the remainder of the middle ages, and Vincent of Beauvais (died about 1264) made an encyclopedia which is still found in every library of pretension. During this period the University of Paris received a thorough organization, and thought there became exclusively concentrated upon theology. The second period, which lasted for about a century, was the great age of scholastic thought, and it may be doubted whether the universities of western Europe have at any subsequent time been so worthy of respect as when Duns Scotus (died 1308) and his followers were working up the realistic conception of existence, while "Durus" Durandus (died 1332), Occam (died about 1349), and Buridanus (died about 1350) were urging their several nominalistic theories, and other writers, now so forgotten that it is useless to name them, were presenting other subtle propositions commanding serious examination. During this period the scholastic forms of discussion were fully elaborated—methods cumbersome and inelegant, but enforcing exactitude, and conformed to that stage of intellectual development. The third period, extending to the time of the extinction of scholasticism, early in the sixteenth century, presented somewhat different characters in different countries. It was, however, everywhere marked by the formal perfectionment of systems, and attention to trivial matters, with decided loss of vitality of thought. Among the innumerable writers of this time may be mentioned Albert of Saxony (fourteenth century), Pierre d'Ailly (1350-1425), Gerson (1363-1420), and Eckius, adversary of Luther. Those subsequent writers who follow colorless traditions of scholasticism, and maintain front against modern thought, must be considered as belonging to an era different from either of those mentioned.

scholia, *n.* Latin plural of *scholium*.

scholiast (skō'li-ast), *n.* [= F. *scolia* = Sp. *escolasta* = Pg. *escolasta* = It. *scolasta* = G. *scholast*, < NL. *scholasta*, < MGr. *σχολαστής*, a commentator, < *σχολάζειν*, write commentaries, < Gr. *σχολῶ*, a commentary: see *scholium*.] One who makes scholia; a commentator; an annotator; especially, an ancient grammarian who annotated the classics.

The title of this satire, in some ancient manuscripts, was "The Reproach of Idleness"; though in others of the *scholiasts* it is inscribed "Against the Luxury and Vices of the Rich."

Dryden, tr. of Persius's Satires, iii., Arg.

The *Scholiasts* differ in that.

Congreve, On the Pindaric Ode, note.

scholialist (skō'li-as'tik), *a.* [*< scholiast + -ic.*]

Pertaining to a scholiast or his pursuits.

scholiazet (skō'li-az), *v. i.* [*< MGr. σχολιάζειν*, write commentaries: see *scholiast*.] To make scholia or notes on an author's work. [Rare.]

He thinks to *scholiazet* upon the gospel.

scholical (skol'i-kal), *a.* [*< "scholice" (< L. scholiceus, < Gr. σχολικός, of or belonging to a school, exetetical, < σχολή, school, etc.: see school¹) + -al.*] Scholastic.

It is a common *scholical* error to fill our papers and notebooks with observations of great and famous events.

scholion (skō'li-on), *n.* Same as *scholium*.

Hereunto have I added a certain Glosse, or *scholion*, for the exposition of old words.

Spenser, To Gabriell Harvey, prefixed to Shep. Cal.

scholium (skō'li-um), *n.*; pl. *scholia*, *scholiums* (-ā, -umz). [Formerly also *scholion*, also *scholy*; < F. *scolie* = Sp. *escolio* = Pg. *escolio* = It. *scolio*, < ML. *scholium*, < Gr. σχολιον, interpretation, commentary, < σχολή, discussion, school: see *school*¹.] A marginal note, annotation, or re-

mark; an explanatory comment; specifically, an explanatory remark annexed to a Latin or Greek author by an early grammarian. Explanatory notes inserted by editors in the text of Euclid's "Elements" were called *scholia*, and the style of exposition resulting from this was considered by later writers somewhat objectionable in their own writings. A geometrical scholium is, therefore, now an explanation or reflection inserted into a work on geometry in such a way as to interrupt the current of mathematical thought.

schollard (skol'ard), *n.* A vulgar corruption of *scholar*.

You know Mark was a *schollard*, sir, like my poor, poor sister; and . . . I tried to take after him.

2. Knowledge gained by systematic observation, experiment, and reasoning; knowledge coordinated, arranged, and systematized; also, the prosecution of truth as thus known, both in the abstract and as a historical development.

Since all phenomena which have been sufficiently examined are found to take place with regularity, each having certain fixed conditions, positive and negative, on the occurrence of which it invariably happens, mankind have been able to ascertain . . . the conditions of the occurrence of many phenomena; and the progress of science mainly consists in ascertaining these conditions.

(A) *Mathematics*, the study of the relations of the parts of hypothetical constructions, involving no observation of facts, but only of the creations of our own minds, having two branches—(1) *pure mathematics*, where the suppositions are arbitrary, and (2) *applied mathematics*, where the hypotheses are simplifications of real facts—and branching again into (a) *mathematical philosophy*, as the theory of probabilities, etc., (b) *mathematical physics*, as analytical mechanics, etc., and (c) *mathematical psychology*, as political economy, etc. (B) *Philosophy*, the examination and logical analysis of the general body of fact—a science which both in reason and in history precedes successful dealing with special elements of the universe—branching into (1) *logic* and (2) *metaphysics*. (C) *Natural science*, the science of the most general laws or uniformities, having two main branches—(1) *psychology* and (2) *general physics*. (D) *Chemistry*, the determination of physical constants, and the study of the different kinds of matter in which these constants differ. (E) *Biology*, the study of a peculiar class of substances, the protoplasm, and of the kinds of organisms into which they grow. (F) *Sciences of organizations of organisms*, embracing (1) *physiology*, the science of the working of physical structures of organs, and (2) *sociology*, the science of psychical unions, especially modes of human society, including ethics, linguistics, politics, etc. (G) *Descriptions and explanations of individual objects or collections*, divided into (1) *cosmology*, embracing astronomy, geognosy, etc., and (2) *accounts of human matters*, as statistics, history, biography, etc.

3. Specifically, the twinkling or tremulous motion of the light of the larger fixed stars. By shaking the head, so as to elongate the image, it is seen that not merely the intensity, but also the color of the light varies. See *scintillometer*.

scintillometer (sin-ti-lom'-e-ter), *n.* [*L. scintilla*, a spark, + *Gr. μέτρον*, measure.] An instrument devised by Montigny for measuring the intensity of scintillation of the stars. The apparatus consists essentially of a circular glass plate mounted obliquely upon an axis very near and in front of the eyepiece of a telescope. An opening in the center of the plate allows the insertion of a ring, through which passes the axis, parallel to the optical axis of the telescope

and at a distance from it of about twenty-five millimeters. The plate is rotated about the axis by a mechanism. By this device, the rays of light from a star are refracted through the inclined glass plate, and the image describes a perfect circle in the field. If the star undergoes no change, the circumference is a continuous line exhibiting the color of the star; but if the star scintillates, this circumference is divided into fugitive arcs of different colors. The number of changes of color per unit of time indicates the intensity of the scintillation.

It includes about 1,500 species, of 17 genera, of which *Scirpus*, the bulrush, is the type. They are grass-like or rush-like plants, with either triangular or rounded stems, and with long flat triangular or cylindrical leaves. The inflorescence becomes chiefly conspicuous when in fruit, and is often ornamental from its shape or from its dark-brown colors, or by reason of the frequent lengthening of the bristles into woolly or plume-like tufts.

(Tournefort, 1700), < L. scirpus, scirpus, a rush, bulrush.*] A genus of monocotyledonous plants including the bulrushes, type of the tribe *Scirpeæ* in the order *Cyperaceæ*. It is characterized by small many-flowered roundish spikelets with imbricated and numerous glumes, each flower bisexual and usually with six bristles, representing a perianth, and surrounding the ovary, from which the continuous and slender style falls away without leaving any conspicuous tubercle. Over 300 species have been described, now reduced to 200 by the best authorities. About 90 species occur in the United States. They are small tufted or floating annuals, or strong perennials with a creeping rootstock, bearing usually a compound panicle of numerous brown spikelets, sometimes reduced to a small cluster or solitary. They are known by the general names *bulrush* and *club-rush*, the first applied especially to *S. lacustris*, a species of peculiar habit, with tall, smooth, round stems of a blue-green color projecting out of lake- and river-waters; also called in England *mat-rush*, from its use in making mats, ropes, chair-bottoms, and hassocks. Its variety *occidentalis* and the kindred species *S. Tatora* are the tule of California. (See *tule*.) *S. maritimus*, the sea club-rush,

By many later, especially German, writers the term has been transferred to the hard bast or liber, a tissue of plants composed of cells whose walls are thickened, often to a very considerable extent. There are over 100 species, natives of tropical and subtropical regions, extending into temperate climates in North America, where 12 species (known as *nutgrass*) occur on the Atlantic coast, 3 as far north as Massachusetts. They are rush-like herbs of various habit, either low and spreading or tall and robust, bearing grass-like leaves, and often with rigid prickly-pointed bracts below the involucre, giving to *S. flagellum* the name *cutting-grass* in the West Indies. See *knife-grass*, *cucuz-grass*, and *Kobresia*.

The epithet notes the corallum, which forms a solid axis that is invested by the soft parts of the animal. The sclerobasic corallum is in reality an exoskeleton, somewhat analogous to the shell of a crustacean, being a true tegumentary secretion. It is termed *testaceous* by Dana. The sclerobasic corallum is produced by a compound organism only, and can be distinguished from a sclerodermic corallum by being usually more or less smooth, and invariably devoid of the cups or receptacles for the separate polyps always present in the latter.—**Sclerobasic Zoantharia**. In birds the sclerotals are usually from twelve to twenty in number.

The sclerotic coat is very dense, almost gristly in some cases; and it is reinforced by a circle of bones the *sclerotals*. These are packed alongside each other all around the circumference of one part of the sclerotic, like a set of splints. . . . It is one of the two largest limicoline families (the other being *Charadriidæ* or plovers), characterized by the length, slenderness, and sensitiveness of the bill, which is in some genera several times as long as the head, grooved for one half to nearly the whole of its length, and forming a delicate probe with which to explore the ground in search of food. The legs

are more or less lengthened, usually bare above the suffrago, scutellate or partly reticulate; there are four toes, with few exceptions, cleft to the base or furnished with one or two basal webs, never full-webbed nor lobate. The *Scolopendria* average of small size, like plovers, they nest almost always on the ground, and lay four pointed pyriform eggs; the young are hatched downy, and run about at once. The family is of cosmopolitan distribution. See *snipe*, and cuts under *Limosa*, *ruf.*, *Rhinophalarus*, *Rhinoceros*, *snipe*, *snipe*, *snipe*, and *redshank*.

Among them are the largest and most formidable centipeds, whose poisonous claws inflict very painful and even dangerous wounds. The fronds are usually large, and coriaceous or subcoriaceous in texture. The genus, which is widely distributed, contains 7 or 8 species. *S. vulgare*, the only species found in North America, is also found in England, Gothland to Spain, Madeira, the Azores, Caucasus, Persia, Japan, and Mexico. It has entire or undulate fronds that are oblong-lanceolate from an auricled heart-shaped base. They are 6 to 18 inches long and from 1 to 2 inches wide. In their larval state these insects do immense damage to forest- and fruit-trees, under the bark of which they bore long galleries, as do the *Bostrychidae*, with which they have been sometimes confounded. Their color is black or brown, and they are almost exclusively lignivorous in habit. Nearly 1,000 species have been described, of which 150 belong to temperate North America. *Xyloborus dispar*, the shot-borer or pin-borer, and *Tomicus calligraphus*, the fine-writing bark-beetle, are familiar examples. See *Xylophaga*, and cut under *pin borer*.

or soft dorsal, teeth on both palatines and vomer, and the caudal obsolete, as *S. scomber*, *S. punctatissimus*, etc. This excludes the frigate-mackerels (*Azura*), the Spanish mackerel (*Scomber morio*), the horse-mackerels, bonitos, tunnies, etc. See *mackerel* 1.

Scomberesoces (skom-be-res'ô-sez), *n. pl.* [NL., pl. of *Scomberesox*.] Same as *Scomberesocidae*.

Scomberesocidae (skom-be-res-os'i-dē), *n. pl.* [NL., < *Scomberesox* (-esoc-) + *-idae*.] A family of syngnathous fishes, typified by the genus *Scomberesox*, to which varying limits have been assigned. They are physoclistous fishes, with the body scaly and a series of keeled scales along each side of the belly, the margin of the upper jaw formed by the intermaxillaries medially and by the maxillaries laterally, the lower pharyngeals united in a single bone, and the dorsal fin opposite the anal. In a broad sense, the family consists of about 8 genera and 100 species, including the belonids or gars, the hemirhamphines or halfbeaks, and the exocoetines or flying-fish. In a restricted sense, it includes the flying-fishes and hemirhamphines as well as the sauries, the belonids being excluded. Also *Scomberesocidae*. See cut under *sauri*.

The body is long, compressed, and covered with small deciduous scales; the jaws are more or less produced into a beak; the gill-rakers are long, slender, and numerous; the air-bladder is large; and there are no pyloric caeca. The dorsal and anal fins are opposite as in *Esoc*, and finlets are developed as in *Scomber*. In *S. saurus*, the true saury, also called *skipper* and *bill-fish*, the beak is long; the color is olive-brown, silvery on the sides and belly; and the length is about 18 inches. This species is wide-ranging in the open sea. *S. brevisstris* is a smaller saury, with the jaws scarcely forming a beak; it is found on the coast of California. Also *Scomberesox*. See cut under *sauri*.

They are fishes of the high sea, graceful in form, beautiful in color, and among the best for the

Spanish Mackerel (*Scomberomorus maculatus*)

table. A technical difference from *Scomber* is the length of the spinous dorsal fin, which has more than twelve spines and is contiguous to the second dorsal, the presence of a caudal keel, the strength of the jaw-teeth, and the weakness of those on the vomerine and palatine bones. This genus used to be called *Cyprum*; its type is the cero, *S. regalis*, which attains a weight of 20 pounds. *S. caballa* sometimes weighs 100 pounds. All the foregoing inhabit the Atlantic, *S. concolor* the Pacific.

Scombridæ (skom'bri-dē), *n. pl.* [NL., < *Scomber*² + *-idae*.] A family of carnivorous physoclistous acanthopterygian fishes, typified by the

genus *Scomber*, to which very different limits have been ascribed. (a) In Günther's system, a family of *Acanthopterygii ostescombriformes*, with unpaired cheeks, two dorsal fins, either finlets or the spines dorsal composed of free spines or modified into a sutorial disk or the ventral pinnules and composed of four rays, and scales none or very small. (b) By Bonaparte, first used as a synonym of *Scomberoides* of Cuvier; later restricted to such forms as had two dorsal fins or the finlets of the first rays of the dorsal spiniform. (c) By Gill, limited to *Scombroidea* of a fusiform shape, with the first dorsal fin elongate, or separated by a wide interval from the soft dorsal, with posterior rays of the second dorsal and of the anal generally detached as special finlets, and with numerous vertebrae. The body is elongate, not much compressed, and covered with minute cycloid scales, or quite naked. The scales sometimes united into a kind of corselet anteriorly, the lateral line is present, the branchiostegals are seven; the dorsal fin two, of which the first has rather weak spines, and the second resembles the anal; the caudal peduncle is very slender, usually keeled, and the lobes of the caudal fin are divergent and falcate, producing the characteristic deeply forked tail. The ventral fins are thoracic in position, of moderate size, with a spine and several soft rays; the vertebrae are numerous (more than twenty-five); pyloric caeca are many; the air-bladder is present or absent; the coloration is metallic and often brilliant. There are 17 genera and about 70 species, all of the high seas and wide-ranging, in some cases cosmopolitan; and among them are extremely valuable food-fishes, as mackerel of all kinds, bonitos, tunnies, and others. See *cut-under-baiter*, *mackerel*, *Scomberomorus*, and *scombrid*.

Scombrinae (skom-bri'nä), *n. pl.* [NL., *< Scomber* + *-inae*.] A subfamily of *Scombridae*, to which various limits have been assigned. (a) By Gill, limited to those *Scombridae* which have two dorsals widely distant, and thus including only the typical mackerels and frigate-mackerels. (b) By Jordan and Gilbert, extended to embrace those with finlets, and with the dorsal spines less than twenty in number. It thus includes the mackerels, frigate-mackerels, tunnies, bonitos, and Spanish mackerel.

scombrine (skom'bri'nä), *n. and a.* I. *n.* A fish of the subfamily *Scombrinae*.

They are numerous in tropical seas. By recent writers two subdivisions are ranked as genera. In the typical species the dorsal spines are seven in number, the pterygoids are armed with teeth, and the scales are normally developed. But in the American representative there are no pterygoid teeth, and the linear scales are embedded. Such is the character of the genus called *Oligoplites*, to which belongs the well-known leather-jacket, *O. occidentalis*, of both coasts of Central America and north to New York and California. It is bluish above, silvery below, with yellow fins.

(b) In Gill's system, those *Scorpenoidae* which have the dorsal fin consisting of an elongated spinigerous or post-thoracic ventrals; head moderately compressed; branchial apertures extending forward and not separated by an isthmus; and a dorsadiform (or nuchadiform) trunk. The northern species mostly live about rocks, and hence their most general name is *rockfish* or *rock-cod*. Many are viviparous, the young being born alive when about a fourth of an inch long; some of them attain a large size, and all are used for food. Besides *Scorpena*, notable genera which include American forms are *Sebastes*, *Sebastodes*, and *Sebastichthys*, including a great variety of rockfish or rock-cod, mainly of the Pacific coast, known as *rose-fish*, *redfish*, *snapper*, *bocaccio*, *morro*, *priest-fish*, *river*, *garraupa*, *flumina*, *rasher* or *rascara*, *tumbor*, *corsair*, *flay-fish*, *rena*, *Spanish flay*, *tree-fish*, etc. See the generic and vernacular names, and cuts under *priest-fish*, *rockfish*, *Sebastes*, *Spanish-flay*, *corsair*, and *Scorpena*.

The constellation, which is prominent in early summer in the skies of the southern United States (where the whole of the magnificent tail clears the horizon), contains the first-magnitude red star Antares and several of the second magnitude. With the Chaldeans and Greeks it extended over one sixth of the planetary circle, the scorpion being represented with exaggerated claws embracing a circular space where *Libra* is now placed. From this irregularity it may be inferred that the constellation is older than the zodiac, which was formed before 2000 B. C. *Libra*, though later, is of no small antiquity, since it appears in the Egyptian zodiacs. Its adoption by Julius Caesar in his calendar made it familiar. Ptolemy, however, though living in Egypt nearly two centuries later, follows Babylonian and Greek astronomers in covering the place of *Libra* with the scorpion's claws. In designating the stars of this constellation by means of the Greek letters, the genitive *Scorpii* (from the alternative Latin form *scorpius*; see *scorpion*) is used; thus, Antares is a *Scorpii*.

Scorpioidea, **Scorpioidea** (skôr-pi-ō-dē-ō, -oi-dē-ō), *n. pl.* [NL.; see *scorpioid*.] Same as *Scorpionida*.

(b) Rolled over or curled like the tail of a scorpion: cincinnal; coiled in a flat spiral.—**2.** In bot., curved or circinate at the end, like the tail of a scorpion; rolled up toward one side in the manner of a crozier, unrolling as the flowers expand, as in some of the *Boraginaceae*. also *scorpius*, < Gr. *σκορπιος* (later also *σκορπιον* in sense of a military engine), a scorpion, also a prickly sea-fish, a prickly plant, the constellation so called, a military engine.] **1.** In zool.,

an arthropod of the order *Scorpionida*. It has an elongated body; the cephalothorax is continuous with the abdomen, which ends in a long slender post-abdomen, which latter can be curled up over the back and is armed at the end with a sharp sting or telson, more or less hooked like a claw, and connected with a venom-gland, so that its puncture inflicts a poisoned wound. (See also cuts under *Buthus* and *Scorpionidae*.) The sting of a scorpion is painful, and is said to paralyze the organs of speech. The scorpion has also a large pair of nippers in front, like the great claws of a lobster, and the whole figure is suggestive of a little lobster, an inch or a few inches long. Scorpions abound in tropical and warm temperate countries. In the former they attain the maximum size of 8 or 10 inches, and are very formidable. They commonly lurk in dark retreats, as under stones and logs, and are particularly active at night. They are carnivorous and predaceous; they seize their prey with their nippers, and sting it to death. Scorpions are justly dreaded, but some popular beliefs respecting them have no foundation in fact, as that when the creature is surrounded by fire it stings itself to death rather than be burned, or that some fluid extracted from a scorpion will cure its sting.

Thes is the *scorpion* that maketh way mid the heauede, and enueymeth mid the tayle.

Apuleius of Lucania (E. E. T. S.), p. 62.

I lyke her to the *scorpion*,
That is a fals flatering beste;
For with his hede he maketh feste,
But al amynd his flatering
With his tayle he wol stinge
And enueyme.

Chaucer, Death of Blanche, l. 636.

And though I once despair'd of woman, now
I find they relish much of *scorpions*.
For both have stings, and both can hurt and cure too.

Beau and Pl., Custom of the Country, v. 6.

'Tis true, a *scorpion's* oil is said
To cure the wounds the vernin made.

S. Butler, Hudibras, III. ii. 1029.

Hence—**2.** Some creature likened to or mistaken for a scorpion, and poisonous or supposed to be so. (a) A false scorpion; any member of the *Pseudoscorpiones*. Among these arachnidans, belonging to the same class as the true scorpion, but to a different order, the members of the genus *Chelifer* are known as *book-scorpions*. (See *Cheliferidae*, and cut under *Pseudoscorpiones*.) Those called *whip-scorpions* are of the family *Thelphididae*. (See cut under *Pedipalpi*.) Closely related to these, and sometimes sharing the name, are the *Phalangida*. (See cut under *Phalangida*.) (b) Centipeds and tarantulas are often confounded in the popular mind with scorpions, as are also (c) various small lizards, in the latter case probably from the habit some of them have of carrying their tails up. Thus, in the United States, some harmless lizards or skinks, as of the genera *Sceloporus* and *Eumeces*, are commonly called *scorpions*. (d) Same as *scorpion-bug*.

3. In ichth., a scorpion-fish or sea-scorpion; one of several different members of the *Scorpenidae*, some of which are also called *scorpene* and *sculpin*. See cut under *Scorpena*, and etymology of *Scelopendra*.—**4.** [cap.] In astron., the eighth sign of the zodiac, which the sun enters about October 23d. See *Scorpio*, 2.

Th' Eternal, to prevent such horrid fray,

Yet seen betwixt *Astræa* and the *Scorpion* sign.

Milton, P. L., iv. 998.

5. A kind of whip said to have been armed with points like that of a scorpion's tail; a scourge, described as having a handle of iron, or of wood braided and ferruled with iron, and two, three, or more chains attached, like the lashes of a whip, and set with balls, rings, or angled and pointed masses of iron.

My father hath chastised you with whips, but I will chastise you with scorpions. 1 Ki. xii. 11.

If the people resisted (Rehoboth), they should be punished not with whips, but with scorpions: that is, rods of knotted wood furnished with barbs, producing a wound like the bite of a scorpion.

Von Ranke, Univ. Hist. (trans.), p. 57.

6. An old military engine, used chiefly in the defense of the walls of a town. It resembled the ballista in form, consisting essentially of two beams with ropes stretched between them, from the middle of which ropes rose a third beam, called the *stylus*, so disposed as to be pulled back and let go at pleasure; to the top of this beam were fastened iron hooks to which a sling of iron or hemp for throwing stones was hung.

Heer crooked Cornies, fleeing bridges tall,
Their scathful Scorpions, that ruyne the wall.
Hudson, tr. of Du Bartas's Judith, iii.

He watched them at the points of greatest danger falling under the shots from the scorpions.

scorpion-fly (skôr'pi-on-ffi), *n.* A neuropterous insect of the family *Panorpidæ*, and especially of the genus *Panorpa*: so called from the forceps-like apparatus at the end of the slender abdomen of the male, and the tendency of the abdomen to curl like the tail of a scorpion. *P. communis* is a European example. See cut under *Panorpa*.

scorpion-grass (skôr'pi-on-gräs), *n.* A plant of the genus *Myosotis*: the forget-me-not or mouse-ear.

Scorpion-grass, the old name of the plant now called *Forget-me-not*. . . . It was called *scorpion-grass* from being supposed, on the doctrine of signatures, from its spike resembling a scorpion's tail, to be good against the sting of a scorpion.

Scorpionida (skôr'pi-on'i-dä), *n. pl.* [NL., < *Scorpion* + *-ida*.] An order of *Arachnida*, having pulmotracheate respiration, the cephalothorax indistinctly segmented from the abdomen, a long jointed postabdomen ending in a hook or telson, and long maxillary palpi, or pedipalps, ending in a usually large chelate claw, or pincer; the true scorpions or *Scorpiones*. The ambulatory legs are seven-jointed, and of moderate and approximately equal lengths. The eyes are from six to twelve

in number. The falcæ or chelicere are well developed and pincer-like. There are four pairs of pulmotracheæ. The long postabdomen or tail is very flexible, and is generally carried curled up over the back; the hook with which it ends is perforated for a poison-duct, and constitutes a sting, sometimes of very formidable character. The order is very homogeneous, and all the forms of it were formerly included in a single family, *Scorpionidæ*, or even in the genus *Scorpio*. It has been divided, according to the number of eyes (six, eight, ten, or twelve), into *Scorpionidæ*, *Teloganida*, *Vesperida*, and *Androctonidæ*, and in other ways. From 1 to more than 30 genera are recognized. See cut for *Scorpionidæ* above, and those under *Buthus* and *Scorpio*. **Scorpionidæ** (skôr'pi-on'i-dë), *n. pl.* [NL., < *Scorpio* (-i) + *-idæ*.] A restricted family of scorpions, typified by the genus *Scorpio*. It has large creamy-white or lemon-colored flowers, resembling a spider, continuing to bloom long from the summit of the spike. 2. *Genista Scorpis* of southwestern Europe. More specifically called **scorpion-broom** and **scorpion-thorn**.

scorpion-senna (skôr'pi-on-sen'ä), *n.* See *Coronilla*, 2.

scorpion-shell (skôr'pi-on-shel), *n.* A gastropod of the family *Strombidæ* and genus *Pteroceras*, distinguished by the development of long tubular or channeled spines from the outer lip of the aperture.

About a dozen species are known, some a foot long, all inhabitants of the Indian seas and the Pacific, as *P. laubis*.

scorpion-spider (skôr'pi-on-spi'êr), *n.* Any arachnid of the order *Pedipalpi*: a whip-scorpion: a sort of false scorpion. Those of the family *Thelyphoniidæ*, with a long slender whip-like postabdomen, resemble scorpions very closely in superficial appearance. The likeness of the *Phrynidæ*, which have merely a button-like postabdomen, is less striking. See cuts under *Phrynidæ* and *Pedipalpi*.

The northern fish formerly referred to the genus, the medialuna of California, a handsome fish a foot long and valued for food, belongs to the genus *Cæsiusoma*. See cut under *Scorpidina*.

Scorpiurus (skôr'pi-û-rus), *n.* [NL. (Linnaeus, 1737), < Gr. *σκορπιουρος*, a plant so called, lit. 'scorpion-tailed,' < *σκορπίος*, scorpion, + *οὐρά*, tail.] A genus of leguminous plants, of the suborder *Papilionaceæ*, tribe *Hedysarææ*, and subtribe *Coronilleæ*. It is characterized by flowers solitary or few on a leafless peduncle with beaked keel-petals, and a cylindrical, furrowed, and circinally coiled pod, which is commonly warty or prickly and does not split open, but breaks across into joints containing roundish seeds with remarkably twisted and elongated seed-leaves. There are about 6 species, natives especially of the Mediterranean region, extending from the Canary Islands into western Asia. They are stemless or decumbent herbs, with entire and simple leaves, unlike most of the family in this last respect, and with small yellow nodding flowers. They are curious but not ornamental plants; their rough coiled pods, called "caterpillars," are sometimes used to garnish dishes. The species have been named **scorpion's-tail** and **caterpillar-plant**.

A genus of composite plants, of the tribe *Cichoriaceæ*, type of the subtribe *Scorzonerææ*. It is characterized by flowers with involucre bracts of many gradually increasing series, plumose and unequal pappus of many rows, and many-ribbed achenes without a beak and commonly without wings. There are about 120 species, natives especially of the Mediterranean region, extending into central Asia. They are smooth, woolly, or bristly plants, generally perennials, bearing alternate and grass-like or broader and dissected leaves, and rather large long-stalked heads of yellow flowers. The best-known species is *S. Hispanica*, the black salsify, much cultivated, chiefly in Europe, for its root, which is used as a vegetable, and has, when moderately boiled, the remedial properties of dandelion. *S. deliciosa* of Sicily is said to be equal to salsify, and *S. crocifolia* in Greece is a favorite salad and spinach. *S. tuberosa* and perhaps other eastern species afford an edible root. An old name of *S. Hispanica* is *viper's-grass*.

scotale (skot'āl), *n.* [Also *scotal* (ML. reflex *scotala*, *scotale*, *scotalium*, *scotalum*); < *scot*² + *ale*.] In law, the keeping of an ale-house within a forest by an officer of the forest, and drawing people (who fear to incur his displeasure) to spend their money there.

Part of the immunity which the outlaws enjoyed was no doubt owing to the connivance of the officers of the forest, who levied forced contributions from them, and compelled all who feared their displeasure to drink at ale-houses which they kept, this extortionate practice being known as *Scothala* or *Scottesale*. These exactions were curbed by the Statute of Fines Levied (27 Ed. I., A. D. 1299), which enacted that, "No Forester or Bied from henceforth shall make *Scotal*, or gather garb, or oats, or any corn, lamb, or pig, nor shall make any (gathering but) by the sight and upon the (view) of the twelve Rangers, when they shall make their (range)."

His method is the logical analysis of the elements of existence. His fundamental doctrine is that distinctions which the mind inevitably draws are to be considered as real, although they do not exist in the things apart from their relations to mind. Such distinctions were called *formal*, the abstractions thence resulting *formalities*, and those who insisted upon them *formalists* or *formalizers* (Middle Latin *formalitates*). He taught the important principle of *hecticity* — that individual existence is no quality, is capable of no description or general conception, but is a peculiar element of being. He held that the natures of genera and species, as *animal* and *horse*, are real, and are not in themselves either general or particular, though they cannot exist except as particular nor be thought except as general. The teaching of Scotism in the English universities was prohibited by the royal injunctions of 1535.

mechanical powers, and is virtually a spiral inclined plane—only the inclined plane is commonly used to overcome gravity, while the screw is more often used to overcome some other resistance. Screws are *right* or *left* according to the direction of the spiral. They are used (1) for balancing forces, as the jack-screw against gravity, the propeller-screw against the resistance of water, ordinary screws against friction in fastening pieces together, the screw-press against elasticity, etc.; and (2) for magnifying a motion and rendering it easily manageable and measurable, as in the screw-feet of instruments, micrometer-

If the hollow screw is turned while the inner one is prevented from turning, the latter advances proportionally to the difference of the pitches.—**Double screw**, a screw which has two consecutive spiral ridges or threads, both having the same pitch.—**Endless screw.** See *endless*. **Female screw.** See *female*.

Flat screw, a spiral groove cut in the face of a disk, which by its revolution communicates a rectilinear motion to a sliding bar carrying a pin which works in the groove.—**Fossil screw.** See *fossil* and *screwstone*.—**Hindley's screw**, a screw cut on a solid, of such form that if any plane be taken through its longitudinal axis, the intersections of the plane by the perimeter are arcs of the pitch-circle of a wheel into which the screw is intended to work. It is so named from having been first employed by Mr. Hindley of York in England.—**Hunter's screw** [named from its inventor, Dr. John Hunter], a double screw consisting of a principal male screw that turns in a nut, but in the cylinder of which, concentric with its axis, is formed a female screw of different pitch that turns on a secondary but fixed male screw. The device furnishes a screw of slow but enormous lifting power without the necessity of finely cut and consequently frail threads. Everything else being equal, the lifting power of this screw increases exactly as the difference between the pitches of the principal male screw and the female screw diminishes, in accordance with the principle of virtual velocities.—**Interior screw.** See *interior*.—**Interrupted screw**, in *mach.*, a screw part or parts of whose thread are cut away, rendering it discontinuous; specifically, a screw whose exterior is divided into six

equal parts, with the screw-threads removed from alternate sectors, used to form the closure of a breech loading cannon. In some cases the interruptions extend entirely around the screw, so that, in the common parlance of mechanics, "every other thread" is removed. Such a screw will turn perfectly in a nut of sufficient length. See *under cut-screw*. **Involution of six screws.** See *involution*. **Left-handed screw,** a screw which is advanced by turning from right to left, in contradistinction to the usual or *right-handed* screw, which turns in the opposite direction. **Male screw.** See *male*. **Metric screw,** a screw in which the pitch is commensurable in units or fractions of a unit of the French metric system. **Milled screw,** a screw with a flat broad head the edge of which is fluted, crenated, or roughened, to afford a firm hold for the fingers. Such screws are much used in chemical, philosophical, and electrical instruments, and in small machines. **Perpetual screw.** Same as *cutless screw* (which see, *under cutless*). **Plane screw.** See *plane*. **Portland screw,** the cast of the interior of a fossil shell, *Cerithium portlandicum*. See *under compound* and *lathe*. **Screw propeller,** a propeller acting on the principle of the screw, attached to the exterior end of a shaft protruding through the hull of a vessel at the stern. It consists of a number of spiral metal blades either cast together in one piece or bolted to a hub. In some special cases, as in ferry-boats, there are two screws, one at each end of the vessel. In some war-vessels transverse shafts with small propellers have been used to assist in turning quickly. An arrangement of screws now common is the twin-screw system, in which two screws are arranged at the stern, each on one of two parallel shafts, which are driven by power independently of the other. By stopping or slowing up one shaft while the other maintains its

velocity, very rapid turning can be effected by twin screws, which have, moreover, the advantage that, one being disabled, the vessel can still make headway with the other. Some vessels designed to attain high speed have been constructed with three screws. A very great variety of forms have been proposed for screw propeller blades; but the principle of the original true screw is still in use. Variations in pitch and modifications of the form of the blades have been adopted with success by individual constructors. The actual area of the screw propeller is measured on a plane perpendicular to the direction in which the ship moves. The outline of the screw projected on that plane is the actual area, but the effective area is, in good examples, from 0.2 to 0.4 greater than this; and it is the effective area and the mean velocity with which the water is thrown astern that determine the mass thrown backward. The mass thrown backward and the velocity with which it is so projected determine the propelling power. A kind of feathering propeller has also been used, but has not been generally approved. Compare *feathering-screw*. See also *cut under bang-frame*.

Compare *conveyor*. **Triple screw,** a screw having three consecutive threads, all of the same pitch. **Under the screw,** subjected to or influenced by strong pressure; compelled; coerced. **Variable screw,** in lathes and other machines, a feed-screw which by the varying velocity of its rotation gives a variable feed. **V-threaded screw,** a screw having a thread of triangular cross-section. See diagram of screw-threads under *screw-thread*. **Winged screw,** a screw with a broad flattened head projecting in a line with its axis so as to be conveniently grasped by the ends of the fingers for turning it. (Rivinus, 1690), so called because reputed a remedy for serofula, or perhaps on account of the knots on the roots resembling serofula; < L. *serofula*, serofula; see *serofula*.] A genus of gamopetalous plants, type of the order *Scrophularineæ*, belonging to the tribe *Cheloneæ*. It is characterized by flowers with a deeply five-cleft calyx, a nearly globose corolla with four short, flat, erect lobes and one spreading in front, four stamens with one-celled anthers, and often a scale-like staminode representing a fifth stamen. The fruit is a rigid two-celled septicidal capsule, roundish and commonly sharp-pointed, containing very numerous wrinkled seeds. There are about 120 species, chiefly Old World plants of the Mediterranean region, also extending widely through the north temperate zone, but very sparingly in America, where 3 species occur in the western United States, one of which, *S. nodosa*, figwort, extends to the Atlantic and to Canada.

They are smooth or bristly herbs, sometimes shrubby, and often fetid. They bear leaves which are chiefly opposite, and are often covered with pellucid dots, and loose cymes of greenish, purplish, or yellow flowers disposed in a terminal thyrsus. The species are known as *figwort*, especially *S. aquatica* of England, also called *water-bellony*, *bullwort*, and *bishop's leaves*, and *S. nodosa*, a widely diffused species of Europe and America, used formerly in medicine in the treatment of serofula, and occasionally still in making ointments for ulcers, etc. See *brownwort*.

Scrophularineæ (skrof'ū-lā-rin'ē-ē), *n. pl.* [NL. (Bentham, 1835), < *Scrophularia* + *-ineæ*.] An important order of gamopetalous plants, of the cohort *Personales* in the series *Bicarpellatæ*, distinguished by a completely two-celled ovary with its placentæ on the middle partition, and by numerous seeds with fleshy albumen. The flowers have usually a persistent five-lobed calyx, a personate and irregularly inflated two-lipped corolla, four didynamous stamens borne on the corolla-tube, often with a staminode representing a fifth stamen, and an entire and sessile ovary which becomes a capsule opening by lines or terminal chinks, or rarely succulent and forming a berry. The order includes about 2,000 species, of 166 genera and 12 tribes, by many grouped in 3 series—the *Pseudosolanaceæ*, with alternate leaves and flatfish flowers, as the mullen, transitional to the *Solanaceæ* or nightshade family; the typical section, the *Antirrhinaceæ*, as the snapdragon, with opposite lower leaves and the upper lip exterior in the bud; and the *Rhinanthideæ*, including the foxglove and *Gerardia*, with various leaves and the lower lip exterior. The species are mainly herbs—a few, as *Paulownia*, becoming trees. Their leaves are entire or toothed, seldom lobed, and always without stipules. The inflorescence is either perfectly centripetal, commonly racemose, or primarily centripetal, the branches however bearing centrifugal clusters, either axillary or forming together a thyrsus. In some exceptional genera the corolla is spreading and nearly flat (see *Veronica*, *Verbasum*, *Limonella*); in many others the typical personate form becomes altered to a funnel-shaped or bell-shaped body, or to an inflated pouch or sac, often with a conspicuous spur. The order is well distributed through all parts of the world; it is most frequent in temperate and montane regions, but is also found within both arctic and tropical climates. About 50 genera are peculiar to America, over half of which belong to North America only; about 23 are confined to South Africa, 15 to Asia, and the others are mostly more widely diffused; 38 genera and about 340 species occur in the United States—one, *Veronica*, extending within the arctic circle. Most species are arid and bit-

The salt waters that cover the greater part of the earth's surface; the ocean. [The word *sea* in compound words always has the meaning of 'ocean.' In this sense, with a hyphen, the word is the first element of numerous names, especially of animals and plants, the more noteworthy of which are entered in the following columns.]

The thriddle day thei rode forth to the Rochell, and ther

entred the *see*. Mertin (E. E. T. S.), iii. 419.

"Here is a royal belt," she cried,

"That I have found in the green *see*."

Robs the vast *sea*. Shak., T. of A., iv. 3. 440.

2. A great body of salt water; a more or less distinctly limited or landlocked part of the ocean having considerable dimensions. Such seas are frequently limited or separated from each other by linear groups of islands; this is especially the case on the Pacific coast of Asia, and in the East Indies, where there are more seas in this sense than anywhere else. Smaller areas thus more or less completely inclosed by land are known as *bays*, *gulfs*, *sounds*, etc. Thus, we speak of the Mediterranean Sea and, as a smaller division of this, the Adriatic Sea; but of the Gulf of Taranto, and the Bay of Naples. The name *sea* is not now usually given to entirely landlocked sheets of water—such use being either traditional, as in the Dead Sea, Sea of Galilee, or exceptional, as in the Caspian Sea, Sea of Aral. *Sea*, *bay*, and *gulf* are more or less synonymous terms. Thus, the Arabian Sea and the Bay of Bengal do not differ essentially in

tus. The Spanish sea-bream is *P. bojaricus*. The black sea-bream is *Cantharus lineatus*. The hecker, *P. orthocentrus*, is known as king of the sea-breams.

podus rayi, distantly related to the mackerels and dolphins.

sea-breeze (sē'brēz), *n.* A breeze blowing from the sea toward the land; specifically, in *meteorol.*, a diurnal breeze felt near the sea-coast, setting in from the sea about 10 A. M., reaching its greatest strength from 2 to 3 P. M., and dying away about sunset. The sea breeze and the corresponding land-breeze together constitute a local convection circulation due to the heating of the land above the ocean temperature during the day and the cooling below it during the night. The upper strata of the air that have become heated and expanded flow off seaward, and produce an increased pressure a short distance from the land. This increment of pressure initiates the sea-breeze, which extends a few miles inland, with a strength depending on the temperature-gradient and on the local topography. Hence it is most strongly marked in equatorial and tropical regions, where the diurnal range of temperature and the contrasts between ocean and land temperatures are greatest; but traces of it have been found even in arctic regions. Steep slopes and mountain-ranges near the coast intensify the sea-breeze by increasing the energy of convection-currents, which in turn create a demand for a greater local surface in-draft. By balloon observations the depth of the sea-breeze at Coney Island has been found to be between 300 and 400 feet. It is mainly the daily sea-breeze which renders the summer climate of the sea-shore markedly invigorating and refreshing.

'of the sea'; cf. Gr. *αἶς*, L. *sal*, the sea; see *sal*¹ and *sal*¹.] 1. A marine carnivorous mammal of the order *Feræ*, suborder *Pinnipedia*, and family *Phocidae* or *Otariidae*: any pinniped not a walrus—for example, a hair-seal, a fur-seal, an eared seal, of which there are numerous genera and species. Seals are regarded as carnivores modified for aquatic life. The modification is profound, and somewhat parallel with that which causes certain other mammals, the cetaceans and sirenians, to resemble fishes in the form of the body and in the nature of the limbs. But seals retain a coat of hair or furlike ordinary quadrupeds, and an expression of the face like that of other carnivores. The body is more or less fusiform, tapering like that of a fish. It is prone, and can scarcely be lifted from the ground, so short are the limbs. These are reduced to mere flippers, especially in the true *Phocidae*, in which the hind legs extend backward and cannot be brought into the position usual to mammals, but resemble the flukes of a cetacean. In the otaries (*Otariidae*) the limbs are freer and less constrained. The latter have small but evident external ears, wanting in the former. The monk-seal, *Monachus albiventer*, lives in the Mediterranean and neighboring Atlantic, and a related species, *Monachus tropicalis*, is found between the tropics in Central American and West Indian waters. Another seal, *Phoca caspica*, inhabits inland waters of the Caspian, Aral, and Baikal. But with few exceptions all seals are maritime and also extratropical. They are especially numerous in high latitudes of the northern hemisphere. Among the *Phocidae* may be noted *Phoca vitulina*, the ordinary harbor-seal or sea-calf, common in British waters and along the Atlantic coast of the United States; it is often tamed and exhibited in aquaria, being gentle and docile, and capable of being taught to perform some amusing tricks; it is one of the smaller species, usually from 3 to 5 feet long, and being the best-known, as well as wide-ranging, it has many local and fanciful names. *Phoca grønlandica* (*Pagophilus grønlandicus*) is the Greenland seal, or harp-seal or saddleback, peculiarly colored, of large size, and an important object of the chase. *Pagomys foetidus* is a smaller species, the ringed seal or floe-rat of Greenland. *Eryngathus barbatus* is the great bearded or square-flipped seal of Greenland, attaining a length of 8 or 10 feet. *Halichærus gryphus* is a great gray seal of both

don, *Stenorhynchus* (or *Ogmorhinus*), *Leptonychotes* (formerly *Leptonyx*), and *Ommatophoca*, form the subfamily *Stenorhynchinae*; some of these are known as *sea-leopards* from their spotted coloration, and others as *sterricks*.

All the foregoing are *Phocidae*, or earless seals, and they are also hair-seals. But the distinction between hair-seals and fur-seals is not, properly, that between *Phocidae* and *Otariidae*, but between those members of the latter family which do not and those which do have a copious under-fur of commercial value. The larger otaries are of the former character; they belong to the genera *Otaria*, *Eumetopias*, and *Zalophus*, are of great size, and are commonly called *sea-lions*; they are of both the northern and the southern hemisphere, chiefly in Pacific waters, and do not occur in the North Atlantic.

The southern fur-seals or sea-bears are species of *Arctocephalus*, and among the smaller otaries. The fur-seal of most economic importance is the North Pacific sea-bear, *Callorhinus ursinus*. Some genera of fossil seals are described. The most important seal-fisheries are those on the Alaskan coast of the United States. On account of the attacks made by Canadians and others upon the seals in the open sea during their migrations to the Pribiloff Islands for the purpose of breeding, the United States endeavored to secure by agreement with Great Britain a season during which the seals should not be molested. This effort failed through the opposition of Canada. The United States then claimed that the waters within which the depredations were committed are within their jurisdiction, and on this ground seized several Canadian vessels. The dispute was submitted to arbitrators who met at Paris in 1893. They denied the United States claim of jurisdiction, awarded damages to Great Britain for the captured vessels, established a close season (May 1 July 31), and prohibited pelagic sealing within sixty miles of the Pribiloff Islands, and sealing in steam-vessels or with firearms. See cuts under *Cystophorinae*, *Eryngathus*, *Eumetopias*, *fur-seal*, *harp-seal*, *otary*, *Pagomys*, *Phoca*, *ribbon-seal*, *sea-elephant*, *sea-leopard*, *sea-lion*, and *Zalophus*.

The great seal of the United Kingdom of England and Scotland is used in sealing the writs to summon Parliament (Irish members included), also in sealing treaties with foreign states, and all other papers of great importance affecting the United Kingdom. The Lord Chancellor is the official custodian of the great seal; during a vacancy in the chancellorship it rests with an officer of equal dignity styled the Lord Keeper. The great seal of Ireland is used in the same manner as before the Union in 1800, except in the matter of summoning Parliament, etc. There is also a seal in Scotland for sealing grants and writs affecting private rights there. The great seal of the United States is placed in the custody of the Secretary of State; State seals usually are in the charge of the State secretaries. Hermetic seal. See *hermetic*.

But popularly and historically the seasons refer to the four well-marked periods which in temperate regions are exhibited in the annual changes of climate and stages of vegetation. sea-trumpet (sē'trum'pet), *n.* 1. A medieval musical instrument essentially similar to the monochord, but suggestive of the viol. It consisted of a wooden body about 6 feet long, flat in front, polygonal behind, and tapering from a somewhat large flat base, which could be rested on the floor, to a short thick neck, terminating in a head with a tuning-screw.

It had but one large string, made of gut, stretched over a peculiar bridge, and tuned to a low pitch, usually about that of the second C below middle C. The bridge was made so as to rest firmly on only one foot, the other being free to vibrate upon the body. The instrument was played with a large bow, like that of a violoncello. The tones used were the natural harmonics of the string, produced by lightly touching the nodes. Its scale therefore coincided with that of the trumpet; and this fact, taken in connection with its general shape, probably suggested its name. It was used for both sacred and secular music, both alone and in sets of three or four. It was especially common in nunneries as an accompaniment for singing, since its tones corresponded in pitch with those of the female voice. The latest specimens date from early in the eighteenth century. The instrument is important in connection with the development of the viol. The typical interval of the second is that between the first and second tones of the major scale, which is acoustically represented by the ratio 9:10. Such a second is called *major*, and also the *greater* or *acute major second*, to distinguish it from the second between the second and third tones of the scale, whose ratio is 9:10, and which is called the *less* or *grave major second*. Both of these contain two half-steps. A second a half-step shorter than the above is called *minor*; and one a half-step longer is called *augmented*. All kinds of seconds are classed as dissonances. Both varieties of major second are also called *whole steps*, *whole tones*, or *simply tones*; and a minor second is also called a *half-step* or *semitone*. See *interval*. The secondary qualities are properly fourteen in number—namely, heavy and light, dense and rare, thick and thin, hard and soft, sticky and friable, rough and smooth, coherent and slippery, color, smell, and taste are also secondary qualities. (b) In *modern* philosophy, since Galileo (who in 1623 calls the qualities known as primary "primi accidenti") and Boyle (who in 1666 uses the term "secondary qualities, if I may so call them"), in precisely the modern signification, affections of bodies, i.e. affective, patible, sensible qualities; imputed qualities; qualities of bodies relative to the organs of sense, as color, taste, smell, etc.; as opposed to those characters (called *primary qualities*, though properly speaking they are not qualities at all) which we cannot imagine bodies as wanting. Secondary as at present used by geologists has a quite different meaning from that which it originally had when introduced by Lehmann, about the middle of the eighteenth century. This classification was improved by Weiner, who intercalated a "Transition series" between the primary and the secondary. See *Mesozoic*, *Paleozoic*, *Tertiary*, and *Transition*.

Secret service, a department of government service concerned with the detection of counterfeiting and other offenses, civil or political, committed or threatened by persons who operate in secrecy. = *Syn.* 1 and 2. **Secret latent**, **Private**, **Covert**, **Occult**, **Clandestine**, hidden, concealed, covered, shrouded, veiled, obscure, recondite, close, unknown. The last four of the italicized words, and in their primary sense the participles, express intentional concealment; the others do not. **Secret** is the most general, but expresses complete concealment. **Latent**, literally lying concealed, may mean hidden from those most concerned; as, I had a latent sense, feeling, or desire; hence its appropriateness in the expression *latent heat*. **Private** (as, it was kept strictly private) emphasizes the fact that some know the thing in question, while others are kept in ignorance. **Covert**—that is, covered—suggests something underhand or well put out of sight; as, a covert motive, sneer, irony; it is opposed to *frank* or *avowed*. **Occult** suggests mystery that cannot be penetrated; as, the occult operations of nature; occult arts. **Clandestine** is now always used for studious or artful concealment of an objectionable or dishonorable sort; as, a clandestine correspondence; it applies especially to action.

3. An officer of state who is charged with the superintendence and management of a particular department of government. (a) In the British government there are five secretaries of state—namely,

those for the home, foreign, colonial, war, and Indian departments. The Secretary of State for the Home Department has charge of the privy signet office, and is responsible for the internal administration of justice, the maintenance of peace in the country, the supervision of prisons, police, sanitary affairs, etc. The Secretary of State for Foreign Affairs conducts all correspondence with foreign states, negotiates treaties, appoints ambassadors, etc. The Colonial Secretary performs for the colonial dependencies similar functions to those of the Home Secretary for the United Kingdom. The Secretary of State for War, assisted by the commander-in-chief, has the entire control of the army; the office dates from 1855, when the office of Secretary at War was merged into it. The Secretary for India governs the affairs of that country with the assistance of a council. Each secretary of state is assisted by two under-secretaries, one permanent and the other connected with the administration. The Chief Secretary for Ireland is not a secretary of state, though his office entails the performance of duties similar to those performed by the secretaries of state. (b) In the United States government six of the executive departments are presided over by secretaries—namely, the Secretary of State, the Secretary of the Treasury, the Secretary of War, the Secretary of the Navy, the Secretary of the Interior, and the Secretary of Agriculture—all members of the cabinet; their duties are described under the names of their respective departments. (See *department*.) Each State has also its Secretary of State, or corresponding officer.

secretary-bird (sek-rē-tār-i-bērd), n. A remarkable raptorial bird of Africa, with very long legs; the serpent-eater or crane-vulture. This bird appears to have been first named *Sagittarius* by Vosmaer in 1769; it is *le secrétaire*, *le message*, and *le mangeur de serpents* of early French writers, and *Falco serpentarius*, *Vultur serpentarius*, *Otis secretarius*, and *Vultur secretarius* of ornithologists of the last century. Between 1797 and 1817 four different generic names were based upon this type (see *Sagittarius*); and since 1800 five specific names have been added (*reptilivorus*, *africanus*, *capensis*, *jambiensis*, and, erroneously, *philippensis*)—the various combinations of the New Latin generic and specific names being now about twenty. The earliest tenable generic name (see *onym*) is *Serpentarius* of Cuvier; the earliest tenable specific name is *secretarius* (Miller, 1785). Some strict constructionists of nomenclatural rules would combine these in the tautology of *Serpentarius secretarius*, a form which has been introduced sparingly into the present work, simply to recognize its existence. The next specific name in chronological order is *secretarius* of Scopoli, 1786, yielding with the proper generic name the unexceptionable

Secretary bird, *Serpentarius secretarius*.

onym *Serpentarius secretarius*. The name *secretary* refers to the bird's crest, which when lying smoothly on the head has been likened to a scribe's pen stuck over the ear; and this is also the explanation of *Sagittarius*. The term *crane-*

culture. (A collection of Higgins' genus *Gopocera*) indicates the bird is like those of a small bird. *Secretarius*, *secretarius*, and *secretarius* describe the bird's character as a secret-keeping species. Most of the remaining birds in the phylum are of the same type, *philop*. The systematic position of this isolated type has been much discussed. It has usually been put in the *Rapt* as a member of either of the families *Falconidae* or *Accipitridae*, or as forming a separate family called *Secretariidae* or *Gopocerae*. Cuvier put the bird among waders, next to the boat-billed herons (*Chloroceryle*). The late Dr. H. Schlegel of Leyden thought it was a goose, and called it *Ascorsecretarius*. The export of the British Museum in the latest official lists locates it next to the crane, which it is transferred to the family *Falconidae* on the strength of the supposed relationship. The appearance of the secretary-bird is somewhat suggestive of the booby (see cut under *hoatzin* and *Ophiochloa*). It is about 4 feet long from the tip of the bill to the end of the tail, the wing from the carpal joint to the point measures 25 inches, the tail is about as long as this, the tarsus 13½ inches. The general color is ashy-gray; the flight feathers, the feathered part of the legs, and the lower belly are black, the breast and under wing- and tail-coverts are whitish, more or less shaded with ashy; the two middle tail-feathers are longer than the rest, white-tipped, and with subterminal black bar. There is a bare orange-yellow space about the eyes; the iris is hazel; the shanks are flesh-colored. The long crest of black or gray black-tipped feathers springs from the hindhead and nape; these feathers are somewhat spatulate, and dispart when the crest is erected under excitement. The serpent-eater has a very capacious gullet and crop, capable of holding at once several snakes two or three feet long; it also eats other reptiles, as lizards, frogs, toads, and young tortoises. It is said to attack large serpents by grasping them in its talons and striking blows with the wings until it can deal a decisive thrust with the beak upon the head of its prey. The bird has often been tamed by the Dutch colonists, and kept to rid their premises of vermin.

2. In *physiol.*: (a) In *animal physiol.*, the process of preparing and separating substances by glandular activity. The product or secretion usually consists of substances previously existing in the blood, such as water, salts, etc., combined with others which have been elaborated by the glandular epithelium from more or less different substances in the blood. The secretion may be eliminated from the body as detrimental, as urine, or it may be used, as the digestive secretions, to serve requirements of the organism or (as the milk) those of its offspring. Secretions which are merely eliminated as detrimental are called *excretions*. The act of secreting seems, in most instances at least, to be a vital act of the glandular epithelium, and is often, if not always, under direct nervous control. (b) In *vegetable*

physiology, the process by which substances are separated from the sap of vegetables. The descending sap of plants is not merely subservient to nutrition, but furnishes various matters which are secreted or separated from its mass, and afterward elaborated by particular organs. These secretions are exceedingly numerous, and constitute the great bulk of the solid parts of plants. They have been divided into—(1) *general or nutritious secretions*, the component parts of which are gum, sugar, starch, lignin, albumen, and gluten; and (2) *special or non-assimilable secretions*, which may be arranged under the heads of acids, alkalis, neuter principles, resinous principles, coloring matters, milks, oils, resins, etc.

sect (sekt), *n.* [*< ME. secte* (= *D. sekte* = *MLG. secta*, *secte* = *MHG. secte*, *G. secte*, *sekte* = *Sw. Dan. sekt*, < *F. or L.*, < *OF. secte*, *F. secte* = *Pr. Sp. secta* = *Pg. secta*, *secta* = *It. setta*, a sect in philosophy or religion, < *LL. secta*, a sect in philosophy or religion, a school, party, faction, class, gild, band, particularly a heretical doctrine or sect; in *ML.* in general a following, suite, a suit at law, a part, train, series, order, suit of clothes, etc.; < *L. secta*, a school or set of doctrines (in philosophy), in earliest use a mode of life, a way, most fre-

quently in the phrase *sectam (alienjus) sequi* or *persequi*, 'follow (some one's) way' (whence *sectam (alienjus) sequi*, 'those following (some one's) way,' one's party, sect, or faction), where *secta* is prop. 'a way, road,' lit. 'a way out through,' being orig. pp., *secta* (se. *via*, way), fem. of *sectus*, pp. of *secare*, cut, as used in the phrase *secare viam*, 'take one's way, travel one's road,' lit. 'cut one's way' (cf. *Gr. τειναι ὁδόν*, cut one's way, take one's way): see *seant*, *sect*, *section*. Cf. *ML. rupta*, a way, road, orig. a road broken through a forest: see *route*, *route*, *ruil*. The *L. secta* has been explained otherwise: (a) According to Skeat and others, lit. 'a follower' (= *Gr. ἑταῖρος*, a follower), with formative *-ta*, < *sequi* (< *sequi*, *sec-* as in *secundus*, etc.) (= *Gr. ἑταῖρος*), follow: see *sequent*. But *secta* is never used in the sense of 'follower,' and the phrase *sectam alienjus sequi* cannot be translated 'follow some one's follower.' (b) *L. secta*, lit. 'a following,' formed from *sequi* as above; but this is equally untenable. The notion of 'a following,' however, has long been present in the use of the word, as in the *ML.* senses: see above, and cf. *seculator*, *suit*, *suite*, ult. < *L. sequi*, follow. (c) The notion that *L. secta* is lit. 'a party cut off,' namely from the true, orthodox, or established church, and thus implies schism and heresy (cf. *sect*), is entirely groundless. Cf. *sept*.] 1. A system or body of doctrines or opinions held by a number of persons and constituting the distinctive doctrines of a school, as propounded originally by the founder or founders of the school and (usually) developed or modified by later adherents; also and usually, the body of persons holding such doctrines or opinions; a school of philosophy or of philosophers: as, the *sect* of Epicurus; the *sect* of the Epicureans.

As of the *secte* of which that he was born

He kepte his lay, to which that he was sworn.

Chaucer, *Squire's Tale*, I. 10.

The academicks were willing to admit the goods of fortune into their notion of felicity; but no *sects* of old philosophers did ever leave a room for greatness. Dryden.

When philosophers in after-times embraced our religion, they blended it often with the peculiar notions of those *sects* in which they had been educated, and by that means corrupted the purity and simplicity of the Christian doctrine. Bp. Atterbury, *Sermons*, I. iv.

2. A party or body of persons who unite in holding certain special doctrines or opinions concerning religion, which distinguish them from others holding the same general religious belief; a distinct part of the general body of persons claiming the same religious name or origin; especially, such a party of innovators, differing in their beliefs from those who support the older or orthodox views; a party or faction in a religious body; a separate ecclesiastical organization; an ecclesiastical denomination: as, the *sects* of the Jewish religion (which were not separately organized); the *sects* of the Christian church (usually separately organized); Mohammedan *sects*; Buddhist *sects*. The Latin word *secta*, from which the English word *sect* is derived, did not at first become limited in Christian usage to a specific meaning. It was used for 'way,' 'mode of life,' etc., but also for the Greek *αἵρεσις* (Latin *hæresis*, the original of the English word *heresy*), signifying 'a school of philosophy, opinion, or doctrine,' especially peculiar or erroneous doctrine. A familiar application was to the sect of Christians, as distinguished from Jews and pagans. In four of the nine passages in which *αἵρεσις* is found in the New Testament, the Vulgate has *hæresis*, in the other five *secta*. In Acts xxiv. 14 it has 'the way (*sectam*) which they call heresy (*hæresin*).' The use of *secta* in these passages led to the meaning of 'a separate or heretical body,' which is found in writers of the fourth century, and by desynonymization *secta* emphasized the organization and *hæresis* the doctrine. Afterward it came to be supposed that the word *secta* meant, etymologically, 'a party cut off'; hence the more or less obnoxious use of *sect* by many writers. It is often used, however, unobnoxiously, in a sense substantially identical with the original sense, to signify 'a body of persons who agree in a particular set of doctrines.'

This newe *secte* of Lollardie. Gower, *Conf. Amant*, Prol.

After the most straitest *sect* of our religion I lived a Pharisee. Acts xxvi. 5.

Slave to no *sect*, who takes no private road,

But looks through nature up to nature's God;

Pursues that chain which links the immense design,

Joins heaven and earth, and mortal and divine.

Pope, *Essay on Man*, iv. 331.

We might say that the massacre of St. Bartholomew was intended to extirpate, not a religious *sect*, but a political party. Macaulay, *Hallam's Const. Hist.*

The eighty or ninety *sects* into which Christianity speedily divided hated one another with an intensity that extorted the wonder of Julian and the ridicule of the Pagans of Alexandria. Lecky, *Europ. Morals*, II. 207.

So is all her *sect*; an they be once in a calin, they are sick.
When she blushes,
It is the holiest thing to look upon,
The purest temple of her *sect* that ever
Made Nature a blest founder.

Specifically—(a) A distinct part or division of a book or writing; a subdivision of a chapter; a division of a law or other writing; a paragraph. (b) In *music*, one of the equal and more or less similar divisions or parts of a melody, or movement. The term is used inconsistently to describe either the half of a phrase or a double phrase. 3. The curve of intersection of two surfaces. —**4.** A representation of an object as it would appear if cut by any intersecting plane, showing the internal structure; a diagram or picture showing what would appear were a part cut off by a plane supposed to pass through an object, as a building, a machine, a biological structure, or a succession of strata. In mechanical drawing, a *longitudinal section* usually presents the object as cut through its center lengthwise and vertically, a *cross-section* or *transverse section* as cut crosswise and vertically, and a *horizontal section* as cut through its center horizontally. *Oblique sections* are made at various angles. Sections are of great importance in geology, as it is largely by their aid that the relations and positions of the various members of the different formations, both stratified and unstratified, are made intelligible. The geological structure of any region is best indicated by one or more cross-sections on which the groups of rocks are represented in the order in which they occur and with the proper dips, as well as the irregularities due to faults, crust-movements, and invasions by igneous masses, by which causes the stratigraphy of a region may be made so complicated and obscure as to be unintelligible without such assistance to its comprehension as is afforded by cross-sections.

5. A thin slice of an organic or inorganic substance cut off, as for microscopic examination. —**6.** In *zool.*, a classificatory group of no fixed grade or taxonomic rank; a division, series, or group of animals: used, like *group*, differently by different authors. Sections, cohorts, phalanges, tribes, etc., are frequently introduced between the family and the order, or between the family and the genus; but it is commoner to speak of *sections* of a genus (*i. e.*, subgenera). The sense corresponds to that of the word *coup* as much used by French zoologists. The sections of many English entomologists often correspond to families as they are understood in continental Europe and the United States.

7. In *bot.*, a group of species subordinate to a genus: nearly the same as *subgenus* (which see). —**8.** In *fort.*, the outline of a cut made at any angle to the principal lines other than a right angle. —**9.** The sign §, used either (*a*) as a mark of reference to a foot-note, or (*b*), prefixed to consecutive numerals, to indicate divisions of subdivisions of a book. —**Abdominal section**, laparotomy. —**Angular sections**. See *angular*. —**Cesarean, conic, dominant sections**. See the adjectives. —**Frontal section**. See *frontal plane*, under *frontal*. —**Frozen section**, a cutting of frozen parts, or that which is cut while frozen; especially, the surface of such cutting. It is much used in anatomy to show the exact relations of soft parts which might be disarranged or distorted if cut in their natural state. —**Golden, macrodiagonal, principal section**. See the adjectives. —**Harmonic section**, the cutting of a straight line at four points harmonically situated. —**Microscopic section**. See *def. 5*, and *section-cutter*. —**Normal section**. Temporal*, etc. See *worldly*.

sedimentary (sed-i-men'ta-ri), *a.* [= *F. sédimentaire; as sediment + -ary.*] In *geol.*, formed by deposition of materials previously held in suspension by water; nearly synonymous with *aqueous*. A rock is *sedimentary* when it has no structure indicating an aqueous origin; it is *sedimentary* when its appearance indicates that it is made up of the detritus of other rocks, eroded and carried away by watery currents, to be deposited in another place. All sedimentary rocks are made up of the fragments of the original crust of the earth, of eruptive materials which have come up through this crust from below, or of other sedimentary beds which, having been deposited, have again in their turn been subjected to erosion and redeposition. It is in sedimentary rocks that organic remains are found; in the original crust of the earth, or in volcanic materials, traces of life could not be expected to occur.—**Sedimentary cataract**, a soft cataract, in which the denser parts have subsided.

The word *see* from meaning any seat of dignity, came to apply specifically to the cathedral, or episcopal throne situated in a cathedral, thence to the city which contained the cathedral and was the chief city of a bishop's diocese, and so in modern usage to the diocese itself. It differs from *diocese*, however, in that *diocese* represents the territorial province for the care of which the bishop is responsible (that is, where his duties lie), whereas *see* is the local seat of his authority, dignity, and episcopal privileges. Both words differ from *bishopric*, in that *bishopric* represents the bishop's office, whether actual or nominal. *See throne*.

It is a body within the pericarp or seed-vessel, containing an organized embryo, or nucleus, which, on being placed under favorable circumstances, develops into an individual similar to that from which it came. The reproductive bodies of the lower or flowerless plants (cryptogams) differ in their mode of germination and in other ways, and are not called true seeds, but *spores*. (See *spore*.) The seed coats are those of the ovule—two, or rarely only one. The outer, answering to the primine, is the more firm and is not rarely crustaceous in texture, and takes the name of *testa* (also *spermoderm* and *episperm*). The inner, answering to the secundine, is called *tegmen* (sometimes *endopleura*); when present, it is always conformed to the nucleus, and is thin or soft and delicate in texture. The seed-stalk or pedosperm, when there is one, is the pedicel or attachment of the seed to the placenta, and answers to the funiculus of the ovule. The chalazae, raphe, and hilum of the ovule retain the same names in the seed. The foramen of the ovule is called the *micropyle* in the seed. The terms which denote the position of the ovule, such as *orthotropous*, *anatropous*, *amphitropous*, etc., also apply equally to the resulting seed. The nucleus may consist of the embryo alone, or of the embryo and the albumen, which is the nourishing substance upon which the developing plant is to feed until it is capable of maintaining itself. See the various terms, and cuts under *anatropous*, *campylotropical*, *Cruciferae*, *ovary*, and *plumule*.

=Syn. 2. *Seem, Look, Appear.* *Look* differs from *seem* only in more vividly suggesting the use of the eye, literally or figuratively: as, it *looks* (or *seems*) right. *Appear* is somewhat stronger, having sometimes the sense of coming into view or coming to seem. Each may stand for that which is probably true, or in opposition to that which is true: not to *seem*, but to be; the *seeming* and the *real*. *Should seem* and *would seem* are equally correct, but differ in strength. To say that a thing *should seem* to be true is to say that it ought to seem so or almost necessarily seems so; to say that it *would seem* true is to say that, while there are reasons for holding an opposite view, the preponderance of evidence is on the side of its being true.

Segholates have a monosyllabic primitive form with one short vowel (a, i, u), belonging usually to the first radical. segment (seg'ment), *n.* [= F. *segment* = Sp. *Pg. segmento* = It. *segmento*, *semento*, < L. *segmentum*, a piece cut off, a strip, segment of the earth, a strip of tinsel, ML. in geom. (tr. A part cut off or marked as separate from others; one of the parts into which a body naturally divides itself; a section: as, the segments of a calyx; the segments of an orange; the segments of a leaf. Specifically, in *zool.* and *anat.*: (a) One of the rings, somites, or metameres of which the body of an animal is theoretically or actually composed, as an arthromere of a worm or crustacean, or a diarthromere of a vertebrate. See cuts under *Callinorpha*, *cephalic*, *Polioptilidina*, *præstomium*, and *promethus*. See cut under *pinion*. (c) One of the three rings or divisions of the skull; a cranial segment, which has been by some considered a modified vertebra.

2. In *geom.*, a part cut off from any figure by a line or plane. A segment of a circle is a part of the area contained within an arc and its chord, as ACB. The chord is some-

II. trans. To separate or divide into segments: as, a segmented cell.

segmenta, *n.* Plural of *segmentum*.

segmental (seg'men-tal), *a.* [cf. *segment* + *-al*.]

1. Having the form of the segment of a circle; being a segment: as, a segmental arch.—2. Of or pertaining to segments or segmentation: as, a segmental formula; segmental parts; segmental organs.—3. Specifically, in *embryol.*, noting the primitive and rudimentary renal organs which occur in all vertebrates and some invertebrates, consisting in the former of branched tubules opening at one end into the somatic cavity and at the other by one or more main ducts into the cloaca or hindgut. The segmental organs of a vertebrate are divisible into three parts, anterior, middle, and posterior. The foremost is the head-kidney or *pronephron*, whose duct becomes a Mullerian duct. The next is the Wolffian body proper, or *mesonephron*, whose duct is the Wolffian duct. The last or hindmost is the rudiment of the permanent kidney, whose duct is the ureter; this is the *metanephron*. The epithet *segmental* in this sense was originally used to note the kind of renal or excretory organs which annelids, as worms and leeches, possess, in more or fewer of the segments of the body, whence the name; it was subsequently extended to the above-described embryonic renal organs of vertebrates which are replaced by permanent kidneys—these segmental organs being thus loosely synonymous with *primitive kidney*, *Wolffian body*, and *pronephron*. See cut under *leech*.

segmentally (seg'men-tal-i), *adv.* In a segmental manner; in segments: as, the spinal nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are termed segmental organs or nephridia.

segmentate (seg'men-tāt), *a.* [cf. L. *segmentatus*, ornamented with strips of tinsel, lit. having segments, < *segmentum*, a segment; see *segment*.] Having segments; segmented. *Encyc. Brit.*, II. 292.

segmentation (seg'men-tā'shon), *n.* [cf. *segment* + *-ation*.] The act of cutting into segments; a division into segments; the condition of being divided into segments; the manner in which a segmented part is divided.—**Segmentation cavity**, in *embryol.*, the central space inclosed by the blastomeres of the embryo, before the formation of a gastrula by invagination; the hollow of a blastosphere; a blastocoele.—**Segmentation nucleus**, the nucleus of an impregnated ovum or germ-cell, resulting from fusion of a male and a female pronucleus, and capable of undergoing segmentation.—**Segmentation of the vitellus**, in *embryol.*, yolk-cleavage; morulation; the first process of germination of the ovum of any metazoic animal, by which the original single cell of which the ovum primitively consists becomes converted, wholly or in part, into a mass of similar cells, constituting a morula or mulberry-mass. The cells thus formed are specified as *cleavage-cells*, *blastomeres*, or *segmentella*. Segmentation goes on in different cases with some variations, chiefly due to the presence of food-yolk and the position of this yolk relatively to the formative yolk (see *centroblephal*, *ectoblephal*). Total segmentation is necessarily restricted to holoblastic ova; it is distinguished from the *partial* segmentation of meroblastic ova (see *holoblastic*, *meroblastic*), the terms meaning respectively that all, or that only some, of the yolk segments. Total segmentation is *equal* or *unequal* when the whole germ-cell divides into two similar cleavage-cells, and these into four, and so on, the resulting gastrula being the archigastrea. Total segmentation is *unequal* or *irregular* when the cleavage-cells are unlike one another; it results in the amphigastrea. The partial segmentation of meroblastic eggs is always unequal, and either *discoidal* with formation of a discogastrea, or *superficial* and forming a perigastrea. Total equal segmentation is also styled *primitive*, *primordial*, and *plakeneitic*, the modifications introduced in unequal and partial segmentation being described as *kenogenetic*. Other terms, descriptive rather than definitive, are used by different

writers; the foregoing is nearly Haeckel's nomenclature. See *egg*, *ovum*, *cellula*, and cuts under *gastrula* and *metablastula*.—**Segmentation rhythm**, the rate of production of successive cleavage-cells, or their numerical ratio of increase, whether 2, 4, 8, 16, 32, etc., or any other mode of multiplication.—**Segmentation sphere**, a ball of cleavage-cells; a blastosphere; a morula.

segmented (seg'men-ted), *a.* [cf. *segment* + *-ed*.] Divided into segments, segmenta, or segmentella; characterized by or exhibiting segmentation; somitic; metameric: thus, the body of a vertebrate is *segmented* according to the number of vertebrae, whether any actual division of parts may be evident or not.

segmentellum (seg'men-tel'um), *n.*; pl. *segmentella* (-i). [NL., dim. of L. *segmentum*, a cutting; see *segment*.] One of the cleavage-cells which result from segmentation of the vitellus of a fecundated ovum: same as *blastomere*. See cut under *gastrulation*.

A circular saw used for cutting veneers from squared logs, consisting of a conical disk having the apex central with the arbor, and very thin firmly toothed segmental saw-plates fastened to the outer margin of the disk. Such a saw having a diameter of 60 inches would be about 16 inches thick at the arbor—the object being to bend the veneers out like a thin shaving as they are sawed from the log.

2. In *surg.*, same as *Key's saw*. See *saw*¹.

If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion.

Seines vary in size from one small enough to take a few minnows to the shad-seine of a mile or more in length, hauled by a windlass worked by horses or oxen or by a steam-engine. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,200 acres of river-bottom; this net was drawn twice in 24 hours.

See *seismometer*.

seismograph (sis'mō-graf), *n.* [< Gr. *seismos*, an earthquake, + *γράφειν*, write.] Same as *seismometer* (which see). The more complicated forms of instruments contrived for the purpose of recording the phenomena of earthquakes are sometimes called *seismographs*, and sometimes *seismometers*. The name *seismograph* was first employed in reference to the elaborate seismometer contrived by Palmieri and used at his station on Mount Vesuvius. This was called by him a "sismografo," and this name has generally been Englished as *seismograph*, which is also the designation most generally applied by the members of the Seismological Society of Japan to the seismometers there contrived and used within the past few years.

The labour of collecting and calculating further and future *seismologies* will be in a great degree thrown away, unless the cultivators of science of all countries . . . shall unite in agreeing to some one uniform system of seismic observation. R. Mallet, in *Trans. Brit. Ass. for Adv. of Sci.*, 1858, p. 1.

seismology (sis'mol'ō-jī), *n.* [< Gr. *seismos*, an earthquake, + *-λογία*, < *λέγειν*, speak: see *-ology*.] The branch of science which has for its object the investigation of the causes and effects of earthquakes, and, in general, of all the conditions and circumstances of their occurrence.

The objects and aims of *Seismology* are of the highest interest and importance to geology and terrestrial physics. R. Mallet, in *Admiralty Manual of Scientific Enquiry* (3d ed.), p. 327.

seismometer (sis-mom'e-tēr), *n.* [< Gr. *seismos*, an earthquake, + *μέτρον*, a measure: see *meter*¹.] An instrument by the aid of which the data are obtained for the scientific study of earthquake phenomena. The forms of instruments used for this purpose are varied, and more or less complicated, in accordance with the wishes and means of the observer. A common bowl partly filled with a viscid fluid, like molasses, which, on being thrown by the earthquake-wave against the side of the bowl, leaves a visible record of the event, is one of the simplest forms of seismometer which have been proposed, as giving a rude approximation to the direction of the horizontal element of the wave. Another simple form of seismometer consists of two sets of cylinders, each set numbering from six to twelve, and the individual cylinders in each uniformly decreasing in size. These are placed on end, one set at right angles to the other, on plates resting on a hard horizontal floor, surrounded by a bed of dry sand, in which the cylinders when overturned will rest, exactly in the position originally given by the shock. This instrument is theoretically capable of giving the velocity of the horizontal component of the shock, its surface-direction in azimuth, or the direc-

tion of the horizontal component of the seismic wave, and also the direction of translation of the wave. In practice, however, the results given by this simple and inexpensive apparatus have not been found satisfactory. The seismometer now most generally used in large observatories, or those where accurate work is expected, involves Zollner's horizontal pendulum, the use of which was proposed many years ago, but which was put into the present practical form by Messrs. Ewing and Gray. The group of instruments constituting the seismometer of Prof. J. A. Ewing is arranged to give a complete record of every particular of the earthquake movement, by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass which is made to revolve uniformly by clockwork, the clock being started by an arrangement similar to that of the Palmieri seismoscope. To this is added another clock which gives the date of the shock and the interval which has elapsed since it took place. Another and simpler form of seismometer designed by Mr. Ewing, and called the "duplex-pendulum seismograph," does not show the vertical element of the disturbance, nor exhibit anything of the relation of time to displacement; but it is in other respects satisfactory in its performance. Of this latter form, fifteen sets were in use in Japan in 1886, and others were being made for other countries. Compare *seismograph*, and see *cut* under *seismoscope*.

Instruments which will in this way measure or write down the earth's motions are called *seismometers* or *seismographs*. Milne, *Earthquakes*, p. 13.

seismoscope (sis'mō-skōp), *n.* [< Gr. *seismos*, an earthquake, + *σκοπεῖν*, view.] A name of the simpler form of seismometer. It is generally so arranged that the exact moment of passage is noted by stopping a clock, either by direct mechanical means or by the use of an electric current. The epoch may also be registered on a revolving cylinder or other similar device. The essential part of a seismoscope usually consists of a delicately suspended or balanced mass, the configuration of which is readily disturbed on the passage of the seismic wave. To construct an instrument which at the time of an earthquake shall move and leave a record of its motion, there is but little difficulty. Contrivances of this kind are called *seismoscopes*. Milne, *Earthquakes*, p. 13.

It is characterized by flowers with a corolla of five or sometimes four equal or unequal spreading lobes, four didynamous or two equal stamens, one-celled anthers, and a superior one- or two-celled ovary, forming one or two small nutlets in fruit, often with a fleshy surface and corky furrowed or perforated interior, investing a pendulous cylindrical seed with fleshy albumen. It is distinguished from the related order *Scrophularinæ* by its solitary ovules, from *Labiata* and *Verbenaceæ* by an embryo with a superior micropyle and radicle, and from its ally the *Myoporinæ* by habit and terminal inflorescence. It includes about 140 species belonging to 8 genera, of which *Selago* is the type. They have the general habit of *Lycopodium* (the ground-pine, club-moss, etc.), differing from it mainly by the dimorphic spores. The stems are copiously branched, trailing, suberect, samentose or scandent; in shape they are more or less distinctly quadrangular, with the faces angled or flat. The leaves are small, with a single central vein, usually tetrastrichous and dimorphous, and more or less oblique, the two rows of the lower plane larger and more spreading, the two rows of the upper ascending, adpressed, and imbricated; spikes usually tetrastrichous, often sharply square, at the end of leafy branches; microsporangia numerous; macrosporangia few, and confined to the base of the spike. About 335 species have been described, from the warmer parts of the globe. 3. In *biol.*, the separation of those forms of
 animal and vegetable life which are to survive
 from those which are to perish; the facts, prin-
 ciples, or conditions of such distinction between
 organisms; also, the actual result of such prin-
 ciples or conditions; also, a statement of or a
 doctrine concerning such facts; especially, natu-
 ral selection. See phrases below. — **Artificial**
selection, man's agency in modifying the processes and
 so changing the results of natural selection; the facts or
 principles upon which such interference with natural
 evolutionary processes is based and conducted. This has been
 going on more or less systematically since man has domes-
 ticated animals or cultivated plants for his own benefit.
 Such selection may be either *unconscious* or *methodical*
 (see below). It has constantly tended to the latter, which
 is now systematically conducted on a large scale, and has
 resulted in numberless creations of utility or of beauty,
 or of both, which would not have existed had the animals and
 plants thus improved been left to themselves — that is, to
 the operation of natural selection. Examples of artificial
 selection are seen in the breeding of horses for speed, bot-
 tom, or strength, or for any combination of these qualities;
 of cattle for beef or milk; of sheep for mutton or wool;
 of dogs for speed, scent, courage, docility, etc.; of pigs for
 fat pork; of fowls for flesh or eggs; of pigeons for fancied
 shapes and colors, or as carriers; in the cultivation of ce-
 reals, fruits, and vegetables to improve their respective
 qualities and increase their yield, and of flowers to enhance
 their beauty and fragrance. — **Methodical selection**, arti-
 ficial selection methodically or systematically carried on
 to or toward a foreseen desired result; the facts or prin-
 ciples upon which such selection is based, and the means
 of its accomplishment. See above.

Methodical selection is that which guides a man who sys-
 tematically endeavours to modify a breed according to
 some predetermined standard.

Darwin, *Var. of Animals and Plants*, xx. 177.

In the case of *methodical selection*, a breeder selects for
 some definite object, and free intercrossing will wholly
 stop his work. *Darwin*, *Origin of Species*, p. 103.

Natural selection, the preservation of some forms of
 animal and vegetable life and the destruction of others,
 in the natural order of such things, by the operation of
 natural causes which, in the course of evolution, favor
 some organisms instead of some others in consequence of
 differences in the organisms themselves. (a) The fact of
 the survival of the fittest in the struggle for existence —
 which means that those animals and plants which are best
 adapted, or have the greatest adaptability, to the conditions
 of their environment do survive other organisms which are
 less adapted, or less capable of being adapted, to such
 conditions. This fact rests upon observation, and is un-
 questionable. (b) The means by which or the conditions
 under which some forms survive while others perish; the
 law of the survival of the fittest; the underlying prin-
 ciple of such survival, and the agencies which effect that
 result. These seem to be mainly intrinsic, or inherent
 in the organism; and they are correlated; in the most vital
 manner possible, with the varying plasticity of different
 organisms, or their degree of susceptibility to modifica-
 tion by their environment. Those which respond most
 readily to external influence are the most modifiable under
 given circumstances, and consequently the most likely to
 be modified in a way that adapts them to their surround-
 ings, which adaptation gives them an advantage over
 less favored organisms in striving to maintain themselves.
 Hence (and this is the gist of Darwinian natural selection)
 — (c) The gradual development of individual differences
 which are favorable to the preservation of the life of the
 individual, with corresponding gradual extinction of those
 peculiarities which are unfavorable to that end; also, the
 transmission of such modified characters to offspring, and
 so the perpetuation of some species and the extinction of
 others — a fact in nature respecting which there is no ques-
 tion, since we know that more species, genera, etc., have
 perished than are now living. (d) The theory of natural
 selection; any statement of opinion or belief on that sub-
 ject, which may or may not adequately reflect the facts in
 the case. Ignorance alike of these facts and of this theory
 has been fruitful of misunderstandings and objections re-
 specting the latter. Some of its supporters have made of
 the theory a cause of the facts which it is simply designed
 to explain; some of its opponents, unconsciously biased
 perhaps by such other extremists, have denied that the
 theory has any validity. Between these extremes, the
 author of the theory states explicitly that it neither origi-
 nates variability, nor accounts for the origin of varia-
 tions, in individuals, still less in species; but that, given
 the origination and existence of variations, it shows that
 some of these are preserved while others are not; that
 favorable variations tend to be perpetuated and unfavor-
 able variations to become extinct; that those variations
 which best adapt an organism to its environment are most
 favorable to its preservation; and, consequently, that the

theory of natural selection is adequate to explain, to some
 extent, the observed fact of the survival of the fittest in
 the struggle for existence — that is, natural selection in
 sense (a) above. Natural selection, in so far as sex is con-
 cerned, is specified as *sexual selection* (see below). The
 facts and principles of natural selection, as recognized and
 used by man for his own benefit in his treatment of plants
 and animals, come under the head of *artificial selection*
 (see above). An extension of the theory of natural selec-
 tion to the origination (as distinguished from the preser-
 vation) of individual variations has been named *physical*
selection (see below).

This preservation of favourable variations and the re-
 jections of injurious variations I call *Natural Selection*.
 Variations neither useful nor injurious would not be af-
 fected by *natural selection*, and would be left a fluctuating
 element, as perhaps we see in the species called poly-
 morphic. *Darwin*, *Origin of Species* (ed. 1860), iv.

Natural selection . . . implies that the individuals
 which are best fitted for the complex and in the course
 of ages changing conditions to which they are exposed
 generally survive and procreate their kind.

Darwin, *Var. of Animals and Plants*, xx. 178.

Physical selection, the law of origin for differential
 changes or modifications in organisms which have arisen
 through the action of physical causes in the environment,
 in habits, etc. It is distinguished from *natural selection*,
 which relates not to the origin but to the preservation of
 these changes. *A. Hyatt*. — **Sexual selection**, that por-
 tion or department of natural selection in which sex is
 especially concerned, or in which the means by which
 one sex attracts the other comes prominently into play.
 Thus, anything which exhibits the strength, prowess, or
 beauty of the male attracts the female, and decides her
 preference for one rather than another individual of the
 opposite sex, with the result of affecting the offspring
 for the better; and this principle of selection, operative
 through many generations, may in the end modify the
 specific characters of animals, and thus become an im-
 portant factor in natural selection.

If it be admitted that the females prefer or are uncon-
 sciously excited by the more beautiful males, then the
 males would slowly but surely be rendered more and more
 attractive through *sexual selection*.

Darwin, *Descent of Man* (ed. 1881), p. 496.

For my own part, I conclude that of all the causes which
 have led to the differences in external appearance between
 the races of men, and to a certain extent between man
 and the lower animals, *sexual selection* has been by far the
 most efficient. *Darwin*, *Descent of Man* (ed. 1871), II. 367.

Unconscious selection, artificial selection effected un-
 knowingly, or carried on without system or method; man's
 agency in unmethodical selection, or the result of that
 agency. See the extract.

Unconscious selection in the strictest sense of the word —
 that is, the saving of the more useful animals and the ne-
 glect or slaughter of the less useful, without any thought
 of the future — must have gone on occasionally from the
 remotest period and amongst the most barbarous nations.
Darwin, *Var. of Animals and Plants*, xx. 199.

 constitute a kind of executive authority. In small towns
 the office is frequently associated with that of assessor
 and overseer of the poor. The office was derived originally
 from that of select vestryman. See *vestry*.

He soon found, however, that they were merely the *se-*
lectmen of the settlement, armed with no weapon but
 the tongue, and disposed only to meet him on the field of
 argument. *Irving*, *Knickerbocker*, p. 235.

selenium (sē-lē'nī-um), *n.* [NL., < Gr. *σεληνη*, the moon (cf. *σεληνιον*, moonlight): see *Selene*. The

element was so called (by Berzelius) because associated with *tellurium* (< *L. tellus*, earth). Chemical symbol, Se; atomic weight, 79.5. A non-metallic element extracted from the pyrite of Fahlun in Sweden, and discovered in 1818 by Berzelius. In its general chemical analogies it is related to sulphur and tellurium. It is found in combination with native tellurium, as in selen tellurium, with sulphur in selen-sulphur, also in very small quantity in some of the varieties of iron pyrites, and in several rare selenides, as clausthalite, or lead selenide, etc. When precipitated it appears as a red powder, which melts when heated, and on cooling forms a brittle mass, nearly black, but transmitting red light when in thin plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxid of selenium, which has a most penetrating and characteristic odor of putrid horse-radish. Selenium undergoes a remarkable change in electrical resistance under the action of light: hence the use of selenium-cells. See *resistance*, 3, and *photophone*.

self (self), *a., pron., and n.* [Also *Se. self*, *self*; < ME. *self*, *self*, *self*, *self* (pl. *selfe*, *seolve*, *selve*, *selve*, *selve*, later *selves*; in oblique cases *selven*), < AS. *self*, *self*, *self*, *self*, *self*, same, *self*, = OS. *self* = OFries. *self*, *selva* = OD. *self*, D. *self* = MLG. *self*, *self*, LG. *selv* = OHG. *selb*, MHG. *selp*, G. *selb* (inflected *selber*, etc.), *selbst* (uninflected) = Icel. *sjálf*, *sjálf* = Sw. *själf* = Dan. *selv* = Goth. *silba*. same, *self*; origin unknown: (a) in one view (Skeat) the orig. form **selba* is perhaps for **seliba*, 'left to oneself,' < *se*, *si* (Goth. *si-k* = L. *se*, oneself, = Skt. *sva*, one's own self), < *lib*, the base of AS. *lifan*, be left, *lāf* = Goth. *laiba*, a remnant, etc. (see *leave*, *life*, *live*).] (b) In another view (Kluge) perhaps orig. 'lord, possessor, owner,' akin to Ir. *selb*, possession; cf. Skt. *patis*, lord, with Lith. *pats*, *self*; cf. also *own*, *v.*, *owner*, with the related *own*, *a.*, which in some uses is nearly equiv. to *self*. The use of *self* in comp. to form the reflexive pronouns arose out of the orig. independent use of *self* following the personal pronouns, and agreeing with them in inflection, in AS. as follows: *ic selfa* (*ic self*), 'I self' (I myself), *min selfes*, 'of me self' (of

myself), *me selfum*, 'to me self' (to myself), *me selfum*, 'me self' (myself), pl. *we selfe*, 'we self' (we ourselves), etc.; so *thou self* ('thou self'), *thou self* (thyself), *thine selfe*, 'of thee self' (of thyself), etc., *he selfe* ('he self'), 'he self' (himself), *his selfe*, 'of him self' (of himself), etc., the adj. *self* becoming coalesced with the preceding pronoun in the oblique cases *mine*, *my*, *me*, *our*, *thine*, *thy*, *thee*, *your*, *his*, *him*, *her*, *their*, *them*, etc., these being ultimately reduced in each instance to a single form, which is practically the dative *me*, *thee*, *him*, *her*, *them*, etc. (in which the acc. was merged), mixed in part with the genitive *mine*, *my*, *our*, *thine*, *thy*, *your*, etc., these orig. genitives in time assuming the appearance of mere possessives, and *self* thus taking on the semblance of a noun governed by them, whence the later independent use of *self* as a noun (see III.). The reflexive combination *me selfe*, *him selfe* (*selve*), etc., came to be used, as the dative of reference, to indicate more distinctly the person referred to — 'I (for) myself,' 'he (for) him self,' etc., thus leading to the emphatic use. The former (AS. ME.) adj. pl. *-e* has now changed to the noun pl. *-es* (*selves*, as in *wolves*, *weres*, etc.). *Itself* and *oneself* retain the original order of simple juxtaposition: *it + self*, *one + self*. In the more common one's *self*, *self* is treated as an independent noun.] I. a. 1. Same; identical; very same; very. [Obsolete or archaic except when followed by *same*. See *selfsame*.]

II. *pron.* A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction, or to denote a reflexive use. Thus, for emphasis, I *myself* will write; I will examine for *myself*; thou *thyself* shalt go; thou shalt see for *thyself*; the writing itself shall be exhibited. "I *myself* will decide" not only expresses my determination to decide, but my determination that no other shall decide. Reflexively, I *abhor myself*; he *admires himself*; it *pleases itself*. *Himself*, *herself*, *themselves* are used in the nominative case as well as in the objective. When the elements are separated by an adjective, *self* becomes a mere noun: as, *my own self*, *our two selves*, *his very self*; so *one's self* for *oneself*. See III.

Now chese yourselfe whether that you liketh.

III. *n.*; pl. *selves* (*selvz*). 1. A person in his relations to that very same person. *Self* differs from *ego* as being always relative to a particular individual, and as referring to that person in all his relations to himself and not merely as given in consciousness.

4. In *hort.*, a flower with its natural plain color; a self-colored flower, as distinguished from one which has become "rectified" or variegated. Compare *self-colored*. (*Self* is the first element in numerous compounds, nearly all modern. It may be used with any noun having an associated verb, or with any participial adjective (in *-ing* or *-ed* or *-en*), or other adjective implying action. It indicates either the agent or the object of the action expressed by the word with which it is joined, or the person on behalf of whom it is performed, or the person or thing to, for, or toward whom or which a quality, attribute, or feeling expressed by the following word belongs, is directed, or is exerted, or from which it proceeds; or the subject of, or object affected by, such action, quality, attribute, feeling, and the like; and the meaning is frequently negative, implying that the relation exists toward *self* only, not toward others: as, *self-acting*, etc. Most of these compounds are of obvious necessity; only the more important of them are given below (without etymology, except when of early formation). In words compounded with *self*, the element *self* has a certain degree of independent accent, generally less than that of the following element, but liable to become by emphasis greater than the latter.) — By one's *self*. Emerson, Courage.

Self-love is not despicable, but laudable, since duties to self, if self-perfecting—as true duties to self are—must needs be duties to others.

Self-love, as understood by Butler and other English moralists after him, is . . . an impulse towards pleasure generally, however obtained.

His putting cobalt (a malleable and ductile metal) among the semi-metals was due to the fact that the nature of this metal was only very imperfectly known at that time.

It is characterized by flowers with numerous or more than five calyx-lobes, as many acute narrow petals, which are entirely separate or united only at the base, usually twice as many stamens, and as many carpels as petals, the fruit consisting of many-seeded follicles. There are about 50 species, natives especially of central and southern Europe, also extending to Madeira and the Canaries, into Asia Minor and the western Himalayas, and into Africa in Nubia and Abyssinia. They are plants of peculiarly fleshy habit, in some species with a leaf-bearing stem, but in most stemless and consisting of a rosette of short and broad alternate fleshy and commonly revolute leaves. The flowers are white, red, green, yellow, or purple, and borne in panicles and commonly compactly flowered cymes. They are remarkable, like the related *Sedum*, for tenacity of life: *S. cespitosum* is said to have grown when planted after being for eighteen months pressed in a herbarium. Those with shrubby stems have yellow or rarely white flowers, are all from the Canary Islands, are cultivated under glass, and show many divergences from the typical structure—some, as the subgenus *Greenovia*, having as many as thirty-two petals. The

best-known species of outdoor cultivation are *S. globifera* (see *hen-and-chickens*) and *S. tetraurum* (the houseleek). The latter is in England a familiar plant, with such old names as *houseleek*, *houseleek's-eye*, *inn-ek*, *joubart*, etc. See *houseleek*, *houseleek tree*.

An assembly or council of citizens invested with a share in the government of a state. Especially (a) In ancient Rome, a body of citizens appointed or elected from among the patricians, and later from among rich plebeians also, or taking seats by virtue of holding or of having held certain high offices of state. Originally the senate had supreme authority in religious matters, much legislative and judicial power, the management of foreign affairs, etc. At the close of the republic, however, and under the empire, the authority of the senate was little more than nominal apart from certain administrative functions, chiefly fiscal, and from its sittings as a high court of justice and as an appellate tribunal. The original senate of the patricians numbered 100; after the adjunction of the tribes Titius or Sabines and Luceres, the number became 300, and remained at this figure for several centuries, with the exception of some temporary changes, until the supremacy of Sulla. Julius Caesar made the number 900, and after his death it became over 1,000, but was reduced to 600 by Augustus, and varied under subsequent emperors. (b) The upper or less numerous branch of a legislature in various countries, as in France, Italy, the United States, and in all the separate States of the Union. The Senate of the United States consists of two senators from each State, and numbers (in 1891) 88 members. A senator must be at least thirty years of age, nine years a citizen of the country, and a resident of the State from which he is chosen. Senators are elected by the State legislatures, and sit for six years, but the terms of office are so arranged that one third of the members retire every two years. In addition to its legislative functions, the Senate has power to confirm or reject nominations and treaties made by the President, and also tries impeachments. The vice-president of the United States is the president of the Senate; in his absence a senator is chosen president pro tempore. The upper house of the Canadian Parliament is also called the Senate; its 80 members are appointed by the crown for life. Hence—(c) In general, a legislative body; a state council; the legislative department of a government.

 the tribe *Lepidinea*. It is distinguished by the fruit,
 a didymous pod of which the rugose and nearly spherical
 valves separate at maturity into two one-seeded nutlets.
 There are 6 species, widely diffused through warm
 and temperate regions of both hemispheres. They are an-
 nual or biennial herbs, nearly prostrate and very much
 branched, bearing alternate entire or dissected leaves,
 and minute white or rarely purple flowers in short racemes
 opposite the leaves. *S. nidolia* of Egypt has been used
 as a salad, as has *S. coronopus*, *herby*, and *back's-horn*. *S.*

Senecio (sē-nē'si-ō), *n.* [*NL. (Tournefort,*
1700), < L. senecio(n)-, a plant, groundsel, so
called in allusion to the receptacle, which is
naked and resembles a bald head; < senecio(n)-,
an old man, < senex, old: see senate. Cf. senecion.]

1. A genus of composite plants, type of the tribe
Senecionideae and subtribe *Eusenecioneae*. It is
 characterized by terminal flower-heads with a broad or
 cylindrical involucre of one or two rows of narrow bracts,
 numerous regular and perfect disk-flowers with truncate
 and cylindrical recurved style-branches and nearly cylind-
 rical five- to ten-ribbed achenes, smooth or but slightly
 downy, and little or not at all contracted at the summit,
 which bears a copious soft white pappus of slender simple
 bristles. Some species have flower-heads calyculate with
 a few bractlets below, and the majority bear spreading pis-
 tillate rays, which are, however, minute in some and in
 others absent. This has been esteemed the largest genus
 of flowering plants containing (including *Cacalia*, with
 Durand, 1888) at least 960 clearly distinct species; it is yet
 uncertain whether or not it is surpassed by the leguminous
 genus *Astragalus*, under which 1,300 species have been
 described, but perhaps not over 900 of these are genuine.
 The species of *Senecio* are mostly herbs, of polymorphous
 habit, either smooth or woolly, and bear alternate or radical
 leaves which are entire, toothed, or dissected. Their
 flower-heads are either large or small, corymbed, panicled,
 or solitary, and are in the great majority of species yellow,
 especially the disk-flowers. The genus is of almost uni-
 versal distribution, but the range of individual species is
 remarkably limited. They are most abundant in temperate
 climates; probably about two thirds of the species
 belong to the Old World, and of these half to South
 Africa and over a fourth to Europe and the Mediter-
 ranean region. About 66 species are found in the United
 States, including the 9 species of *Cacalia* (Tournefort,
 1700), separated by many authors; the others are chiefly
 low or slender herbs with bright-yellow rays, most nu-
 merous in the central States. American species are
 much more abundant in the Andean region, where they
 assume a shrubby habit and in three fourths of the species
 develop no ray-flowers, the reverse of the proportion else-
 where. Many of the Andean species grow close to the
 snow-line, and have leaves quite glossy and glutinous
 above and clothed with warm wool beneath; some gummy-
 leaved species have been used for firewood by the Bolivians
 under the name *tola*. In St. Helena and New Zealand a
 number of species become small trees. (See *he-cabbage-tree*
and puka-puka.) (For the principal British and American
 species, see *rapwort*, *liverwort*, and *jacobaea*; for the original
 species, *S. vulgaris*, a weed sold for cage-birds in London
 under the names *bird-seed* and *chickenweed*, and also called
senecion and *simson*, see *groundsel*.) Several species have
 been in repute as remedies for wounds, as *S. saracenicus* (for
 which see *Saracen's confrey*, under *Saracen*). *S. paludosus*
 is known as *bird's-tongue*, *S. hieracifolius* as *hawkweed*,
 and *S. lyallii*, of New Zealand, as *mountain-marigold*. *S.*
lobatus, a tall and rather showy species of the southern
 United States, is known as *butterweed*, from its fleshy
 leaves. *S. cineraria*, a bushy yellow-flowered perennial
 of Mediterranean shores from Spain to Greece and Egypt,
 is the dusty miller of gardens, valued for its numerous
 long and pinnately cleft leaves, remarkably whitened with

close down; from it the native dusty-miller of the Atlantic
 coast, *Artemisa Stilleriana*, is distinguished by its short,
 roundish, less deeply cut leaves. *S. miktanoides*, Cape ivy,
 a tender climber with smooth and shining bright-green
 angled leaves, from the Cape of Good Hope is a favorite
 in cultivation. Several species are cultivated for their
 flowers under the generic name *Senecio*, as the orange *S.*
japonicus, and the purple and yellow *S. pulcher*, which
 reach nearly or quite 3 inches in diameter. *S. arvensis*,
 the silvery senecio, a dwarf 2 inches high, is valued for
 edgings, and several others for rock-gardens. The most
 important species, perhaps, are those of the section *Cine-*
raria, cultivated under glass, some of which have deep
 blue rays, a color elsewhere absent from this genus as
 from most other composite genera.

2. [*l. c.*] A member of this genus.

senecioid (sē-nē'si-oid), *a.* [*NL., < Senecio +*

(Lessing, 1832), < Senecion(n)- + -id-ae.] A tribe
 of composite plants, characterized by usually
 radiate flower-heads, nearly equal involucre
 bracts in one or two rows, pappus composed
 of bristles, anthers with a tailless base or with
 two short points, and penciled, truncate or ap-
 pendaged style-branches in the perfect flowers.
 It includes 4 subtribes, of which *Liabum*, *Tussilago*, *Senecio*,
 and *Othonna* are the types, and comprises 43 genera
 and about 1,300 species, which extend into all parts of
 the world. They are mainly annual and perennial herbs
 with alternate leaves and yellow disk-flowers, often also
 with yellow rays. Among other genera, *Petasites*, *Arnica*,
Doronicum, and *Erechtites* are represented in the United
 States.

senega (sen'é-gā), *n.* [*NL.; see Seneca-oil.*] A
 drug consisting of the root *Polygala Senega*, the
 Seneca snakeroot. The drug is said to have been used
 as an antidote for the bite of the rattlesnake. It is now
 almost exclusively used as an expectorant and diuretic.
Also seneca.

Senegal (sen'é-gal), *a. and n.* [*< Senegal* (see
 def.)] 1. *a.* Of or pertaining to Senegal, a river
 in western Africa, and the region near it. Compare

II. *n.* [*l. c.*] A dealers' name of the small
 African blood-finches of the genus *Lagono-*
sticta. They are tiny birds, averaging under 4 inches
 long, and would be taken for little finches, but belong to
 the sparrow-like group of the *Ploce-*
idae (not to *Fringill-*
idae). More than
 20 species of *Lago-*
nosticta are de-
 scribed, all Afri-
 can; they are close-
 ly related to the
 numerous species
 of *Spermestes*, all
 likewise African,
 and of *Estrela*
 and its subdivi-
 sions, mainly Afri-
 can, but also Indi-
 an, some of which
 are known to the
 dealers as *ama-*
davats, *strawberry-*
finches, etc. The
 blood-finches (*Lagonosticta* proper) are so called from their
 leading color, a rich crimson, shaded into browns, grays,
 and black, and often set off with pearly white spots. Several
 different birds share the name *senegal*. That to which
 it specially pertains inhabits Senegambia; it is the *sené-*
gali of the early French and the *pre-bird* or *pre-finch* of
 the early English ornithologists, the *Fringilla senegala* of
 Linnaeus, and the *Estrela senegala* of many writers; it is 3½
 inches long, the male mostly crimson, with black tail and
 brown belly, and the back brown washed over with crim-
 son. *L. minima* is scarcely different, but slightly smaller,
 and has a few white dots on the sides of the breast.

sensation (sen-sā'shon), *n.* [*< OF. sensacion*, *F. sensation = Pr. sensacion = Sp. sensacion = Pg. sensação = It. sensazione*; *< ML. *sensatio(n-)*, *< L. sensatus*, endowed with sense; see *sensate*.] 1. The action, faculty, or immediate mental result of receiving a mental impression from any affection of the bodily organism; sensitive apprehension; corporeal feeling; any feeling; also, the elements of feeling or immediate consciousness and of consciousness of reaction in perception; the subjective element of perception. *Sensation* has to be distinguished from *feeling* on the one hand, and from *perception* on the other. All are abstractions, or objects segregated by the mind from their concomitants, but perception is less so and feeling more so than sensation. *Sensation* is feeling together with the direct consciousness of that feeling forcing itself upon us, so that it involves the essential element of the conception of an object; but sensation is considered apart from its union with associated sensations, by which a perception is built up. Sensations are either peripheral or visceral. Among the latter are to be specially mentioned sensations of operations in the brain. No approach to a satisfactory enumeration of the different kinds of sensations, even of the peripheral kind, has been made.

Those that make motion and *sensation* thus really the same, they must of necessity acknowledge that no longer motion, no longer *sensation*, . . . and that every motion or reaction must be a new *sensation*, as well as every ceasing of reaction a ceasing of *sensation*.

Dr. H. More, Immortal. of Soul, II. i. 12.

The perception which actually accompanies and is annexed to any impression on the body made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call *sensation*.

Locke, Human Understanding, II. xix. 1.

Sensation, so long as we take the analytic point of view, differs from perception only in the extreme simplicity of its object or content. . . . From the physiological point of view both *sensations* and perceptions differ from thoughts in the fact that nerve-currents coming in from the periphery are involved in their production.

W. James, Prin. of Psychology, xvii.

Impressions may be divided into two kinds, those of *sensation* and those of reflection. The first kind arises in the soul originally, from unknown causes.

Hume, Treatise of Human Nature, I. ii.

The feelings which accompany the exercise of these sensitive or corporeal powers, whether cognitive or appetent, will constitute a distinct class, and to these we

may with great propriety give the name of *sensations*; whereas on the feelings which accompany the energies of all our higher powers of mind we may with equal propriety bestow the name of sentiments.

Sir W. Hamilton, Metaph., xlv.

Unlucky Welsted! thy unfeeling master,
The more thou ticklest, gripes his fist the faster.
While thus each hand promotes the pleasing pain,
And quick sensations skip from vein to vein.

sensational (sen-sā'shon-al), *a.* [*< sensation + -al.*] 1. Of or pertaining to sensation; relating to or implying sensation or perception through the senses.

Harper's Mag., LXXVII, 695.

sensationalist (sen-sā'shon-al-ist), *n.* [*< sensational + -ist.*] 1. In *metaph.*, a believer in or an upholder of the doctrine of sensationalism or sensualism: sometimes used adjectively.

Accordingly we are not surprised to find that Locke was claimed as the founder of a *sensationalist* school, whose ultimate conclusions his calm and pious mind would have indignantly repudiated. . . . We consider this on the whole a less objectionable term than "sensualist" or "sensuist"; the latter word is uncouth, and the former, from the things which it connotes, is hardly fair.

Farrar, Origin of Language, p. 150, and note.

2. A sensational writer or speaker.

sensationalistic (sen-sā'shon-al-ist'ik), *a.* [*< sensationalist + -ic.*] Of or pertaining to sensationalists, or sensationalism in philosophy. *Encyc. Brit.*, XXI, 40.

It. *sensio*, *< L. sensus*, feeling, sense, *< sentire*, pp. *sensus*, feel, perceive; see *scent*.] 1. The capacity of being the subject of sensation and perception; the mode of consciousness by which an object is apprehended which acts upon the mind through the senses; the capacity of becoming conscious of objects as actually now and here; sense-perception; mental activity directly concerned in sensations.

Sense thinks the lightning born before the thunder:
What tells us then they both together are? . . .
Sense outdies knows, the soul through all things sees.

Locke, Human Understanding, II. ix. 4.

These two doctrines of Leibnitz—that *sense* is confused thought, and that existence in space and time is a phenomenon *reale*—have a special importance when viewed in relation to the ideas of Kant.

E. Caird, Philos. of Kant, p. 91.

Errors of *sense* are only special instances where the mind makes its synthesis unfortunately, as it were, out of incomplete data, instantaneously and inevitably interpreting them in accordance with the laws which have regulated all its experience.

G. T. Ladd, Physiol. Psychology, p. 455.

2. A special faculty of sensation connected with a bodily organ; the mode of sensation awakened by the excitation of a peripheral nerve. In this signification, man is commonly said to have five senses—sight, hearing, smell, taste, and touch—a correct enumeration, perhaps, according to organs, but each of these organs has several different qualities of sensation. A sixth sense is often specified as the muscular sense (distinguished from touch); a seventh is sometimes spoken of, meaning the inner sense, the common sense of Aristotle, an unknown endowment, or a sexual feeling; and further subdivisions also are made. The seven senses are also often spoken of, meaning consciousness in its totality.

Whiles every *sence* the humour sweet embayd.

Spenser, F. Q., i. ix. 13.

The filly was soon scared out of her seven *senses*, and began to calcitrate it, to wince it, to frisk it.

While the blithe season comforts every *sense*.

A. C. Swinburne, Two Dreams.

4. A power of perceiving relations of a particular kind; a capacity of being affected by certain non-sensuous qualities of objects; a special kind of discernment; also, an exertion of such a power: as, the religious *sense*; the *sense* of duty; the *sense* of humor.

Sense of Right and Wrong [is] as natural to us as natural affection itself, and a first principle in our constitution and make.

Shaftesbury, Inquiry, I. iii. § 1, quoted in Fowler, p. 70.

Tempests themselves, high seas and howling winds,
The gutter'd rocks and congregated sands—

All these words apply both to the person and to his opinions, words, writings, etc.
